Project: **I-15 CIP ADL Survey**
Project No.: **603008001**
Lab I.D.: **090806-52 through -116**

Dear Ms. Stout:

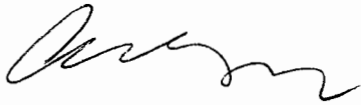

The **analytical results** for the soil and water samples, received by our lab on August 6, 2009, are attached. The samples were received chilled, intact and with chain of custody record.

Enviro-Chem appreciates the opportunity to provide you and your company this and other services. Please do not hesitate to call us if you have any questions.

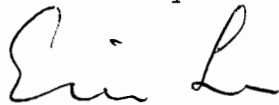

Sincerely,

Curtis Desilets
Vice President/Program Manger

Lab I.D.: **090602-1 through 090814-49**

Dear Ms. Stout:

The **analytical results** for the soil and water samples, received by our lab on June 1-August 3, 2009, are attached. The samples were received chilled, intact and with chain of custody record.

Enviro-Chem appreciates the opportunity to provide you and your company this and other services. Please do not hesitate to call us if you have any questions.

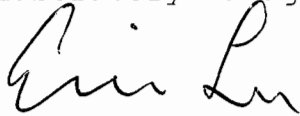

Sincerely,

Curtis Desilets
Vice President/Program Manger

Project: **I-15 CIP ADL Survey**
Project No.: **603008001**
Lab I.D.: **100309-11 through -69**

Dear Ms. Stout:

The **analytical results** for the soil and water samples, received by our lab on March 9, 2010, are attached. The samples were received chilled, intact and with chain of custody record.

Enviro-Chem appreciates the opportunity to provide you and your company this and other services. Please do not hesitate to call us if you have any questions.

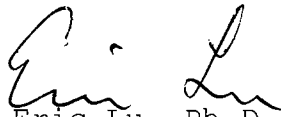

Sincerely,

Curtis Desilets

Method Blank --- ND 1

PQL 0.50

COMMENTS:

DF = Dilution Factor
 PQL = Practical Quantitation Limit
 Actual Detection Limit = DF X PQL
 ND = Non-Detected or below the Actual Detection Limit
 TTLC = Total Threshold Limit Concentration
 STLC = Soluble Threshold Limit Concentration
 STLC Limit for lead = 5 PPM
 * = STLC analysis is recommended (if marked)
 *** = The concentration exceeds the TTLC Limit @ 1000 PPM, therefore the sample is defined as hazardous waste as per CCR-TITLE 22 (if marked)

Data Reviewed and Approved by:

Dear Ms. Stout:

The **analytical results** for the soil and water samples, received by our lab on March 9, 2010, are attached. The samples were received chilled, intact and with chain of custody record.

Enviro-Chem appreciates the opportunity to provide you and your company this and other services. Please do not hesitate to call us if you have any questions.

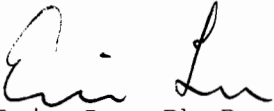

Sincerely,

Curtis Desilets

Dear Ms. Stout:

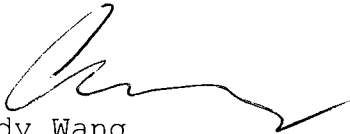

The **STLC DI-Pb results** for the soil and water samples, received by our lab on March 9, 2010, are attached. The samples were received chilled, intact, accompanying chain of custody and also stored per the EPA protocols.

Enviro-Chem appreciates the opportunity to provide you and your company this and other services. Please do not hesitate to call us if you have any questions.

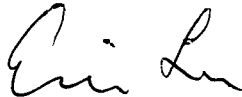

Sincerely,

Curtis Desilets

Dear Ms. Stout:

The **analytical results** for the soil and water samples, received by our lab on March 10, 2010, are attached. The samples were received chilled, intact and with chain of custody record.

Enviro-Chem appreciates the opportunity to provide you and your company this and other services. Please do not hesitate to call us if you have any questions.

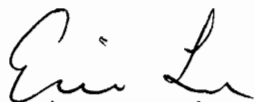

Sincerely,

Curtis Desilets

Lab I.D.: **100310-67 through -123**

Dear Ms. Stout:

The **analytical results** for the soil and water samples, received by our lab on March 10, 2010, are attached. The samples were received chilled, intact and with chain of custody record.

Enviro-Chem appreciates the opportunity to provide you and your company this and other services. Please do not hesitate to call us if you have any questions.

Sincerely,

Curtis Desilets

EPA 6010B FOR TTLC-LEAD; PAGE 1 OF 3
UNITS: mg/Kg = MILLIGRAM PER KILOGRAM = PPM

Table with 4 columns: SAMPLE I.D., LAB I.D., TTLC-LEAD RESULT, DF. Rows include sample IDs like C0261-0.5, C0261-1.0, etc., and a Method Blank row. PQL is listed as 0.50.

COMMENTS:

DF = Dilution Factor
PQL = Practical Quantitation Limit
Actual Detection Limit = DF X PQL
ND = Non-Detected or below the Actual Detection Limit
TTLC = Total Threshold Limit Concentration
STLC = Soluble Threshold Limit Concentration
STLC Limit for lead = 5 PPM
* = STLC analysis is recommended (if marked)
*** = The concentration exceeds the TTLC Limit @ 1000 PPM, therefore the sample is defined as hazardous waste as per CCR-TITLE 22 (if marked)

Dear Ms. Stout:

The **analytical results** for the soil and water samples, received by our lab on March 11, 2010, are attached. The samples were received chilled, intact and with chain of custody record.

Enviro-Chem appreciates the opportunity to provide you and your company this and other services. Please do not hesitate to call us if you have any questions.

Sincerely,

Curtis Desilets

EPA 6010B FOR TTLC-LEAD; PAGE 3 OF 3
 UNITS: mg/Kg = MILLIGRAM PER KILOGRAM = PPM

SAMPLE I.D.	LAB I.D.	TTLC-LEAD RESULT	DF
D0315-0.5	100311-48	10.7	1
D0315-1.0	100311-49	8.22	1
D0315-2.5	100311-50	7.38	1
D0315-5.0	100311-53	11.0	1
D1315-0.5	100311-54	6.92	1
D1315-1.0	100311-55	9.90	1
D1315-2.5	100311-56	8.45	1
D1315-5.0	100311-57	5.54	1
D0316-0.5	100311-58	12.8	1
D0316-1.0	100311-59	12.4	1
D0316-2.5	100311-60	5.84	1
D0316-5.0	100311-61	8.67	1
Method Blank	---	ND	1
	PQL	0.50	

COMMENTS:

DF = Dilution Factor
 PQL = Practical Quantitation Limit
 Actual Detection Limit = DF X PQL
 ND = Non-Detected or below the Actual Detection Limit
 TTLC = Total Threshold Limit Concentration
 STLC = Soluble Threshold Limit Concentration
 STLC Limit for lead = 5 PPM
 * = STLC analysis is recommended (if marked)
 *** = The concentration exceeds the TTLC Limit @ 1000 PPM, therefore the sample is defined as hazardous waste as per CCR-TITLE 22 (if marked)

Dear Ms. Stout:

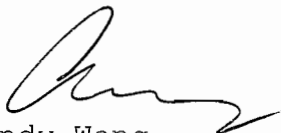

The **analytical results** for the soil and water samples, received by our lab on March 11, 2010, are attached. The samples were received chilled, intact and with chain of custody record.

Enviro-Chem appreciates the opportunity to provide you and your company this and other services. Please do not hesitate to call us if you have any questions.

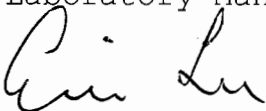

Sincerely,

Curtis Desilets

PROJECT: I-15 CIP ADL Survey PROJECT No.: 603008001
MATRIX:SOIL DATE RECEIVED:03/11/10
SAMPLING DATE:03/10/10 DATE ANALYZED:03/12/10
REPORT TO:MS. KRISTIN STOUT DATE REPORTED:03/18/10

EPA 6010B FOR TTLC-LEAD; PAGE 1 OF 4
UNITS: mg/Kg = MILLIGRAM PER KILOGRAM = PPM

Table with 4 columns: SAMPLE I.D., LAB I.D., TTLC-LEAD RESULT, DF. Rows include sample IDs like C0249-0.5, C0249-1.0, etc., and a Method Blank row. A PQL value of 0.50 is also listed.

COMMENTS :

DF = Dilution Factor
PQL = Practical Quantitation Limit
Actual Detection Limit = DF X PQL
ND = Non-Detected or below the Actual Detection Limit
TTLC = Total Threshold Limit Concentration
STLC = Soluble Threshold Limit Concentration
STLC Limit for lead = 5 PPM
* = STLC analysis is recommended (if marked)
*** = The concentration exceeds the TTLC Limit @ 1000 PPM, therefore the sample is defined as hazardous waste as per CCR-TITLE 22 (if marked)

Dear Ms. Stout:

The **analytical results** for the soil and water samples, received by our lab on March 12, 2010, are attached. The samples were received chilled, intact and with chain of custody record.

Enviro-Chem appreciates the opportunity to provide you and your company this and other services. Please do not hesitate to call us if you have any questions.

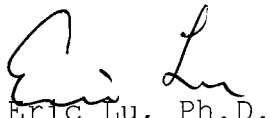

Sincerely,

Curtis Desilets

Dear Ms. Stout:

The **analytical results** for the soil and water samples, received by our lab on March 12, 2010, are attached. The samples were received chilled, intact and with chain of custody record.

Enviro-Chem appreciates the opportunity to provide you and your company this and other services. Please do not hesitate to call us if you have any questions.

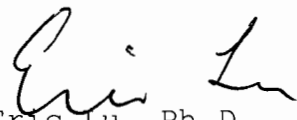

Sincerely,

Curtis Desilets

Method Blank --- ND 1

PQL 0.50

COMMENTS:

DF = Dilution Factor
 PQL = Practical Quantitation Limit
 Actual Detection Limit = DF X PQL
 ND = Non-Detected or below the Actual Detection Limit
 TTLC = Total Threshold Limit Concentration
 STLC = Soluble Threshold Limit Concentration
 STLC Limit for lead = 5 PPM
 * = STLC analysis is recommended (if marked)
 *** = The concentration exceeds the TTLC Limit @ 1000 PPM, therefore the sample is defined as hazardous waste as per CCR-TITLE 22 (if marked)

Dear Ms. Stout:

The **analytical results** for the soil and water samples, received by our lab on March 16, 2010, are attached. The samples were received chilled, intact and with chain of custody record.

Enviro-Chem appreciates the opportunity to provide you and your company this and other services. Please do not hesitate to call us if you have any questions.

Sincerely,

Curtis Desilets

PROJECT: I-15 CIP ADL Survey PROJECT No.: 603008001
MATRIX: SOIL DATE RECEIVED: 03/16/10
SAMPLING DATE: 03/15/10 DATE ANALYZED: 03/17/10
REPORT TO: MS. KRISTIN STOUT DATE REPORTED: 03/23/10

EPA 6010B FOR TTLC-LEAD; PAGE 1 OF 4
UNITS: mg/Kg = MILLIGRAM PER KILOGRAM = PPM

Table with 4 columns: SAMPLE I.D., LAB I.D., TTLC-LEAD RESULT, DF. Rows include sample IDs like D0331-0.5, D0331-1.0, etc., and a Method Blank row. PQL is listed as 0.50.

COMMENTS:

DF = Dilution Factor
PQL = Practical Quantitation Limit
Actual Detection Limit = DF X PQL
ND = Non-Detected or below the Actual Detection Limit
TTLC = Total Threshold Limit Concentration
STLC = Soluble Threshold Limit Concentration
STLC Limit for lead = 5 PPM
* = STLC analysis is recommended (if marked)
*** = The concentration exceeds the TTLC Limit @ 1000 PPM, therefore the sample is defined as hazardous waste as per CCR-TITLE 22 (if marked)

Project: **I-15 CIP ADL Survey**
Project No.: **603008001**
Lab I.D.: **100316-119 through -154**

Dear Ms. Stout:

The **analytical results** for the soil and water samples, received by our lab on March 16, 2010, are attached. The samples were received chilled, intact and with chain of custody record.

Enviro-Chem appreciates the opportunity to provide you and your company this and other services. Please do not hesitate to call us if you have any questions.

Sincerely,

Curtis Desilets
Vice President/Program Manger

EPA 6010B FOR TTLC-LEAD; PAGE 1 OF 3
UNITS: mg/Kg = MILLIGRAM PER KILOGRAM = PPM

Table with 4 columns: SAMPLE I.D., LAB I.D., TTLC-LEAD RESULT, DF. Rows include sample IDs like C0221-0.5, C0221-1.0, etc., and a Method Blank row. PQL is listed as 0.50.

COMMENTS:

DF = Dilution Factor
PQL = Practical Quantitation Limit
Actual Detection Limit = DF X PQL
ND = Non-Detected or below the Actual Detection Limit
TTLC = Total Threshold Limit Concentration
STLC = Soluble Threshold Limit Concentration
STLC Limit for lead = 5 PPM
* = STLC analysis is recommended (if marked)
*** = The concentration exceeds the TTLC Limit @ 1000 PPM, therefore the sample is defined as hazardous waste as per CCR-TITLE 22 (if marked)

Project: **I-15 CIP ADL Survey**
Project No.: **603008001**
Lab I.D.: **100317-22 through -83**

Dear Ms. Stout:

The **analytical results** for the soil and water samples, received by our lab on March 17, 2010, are attached. The samples were received chilled, intact and with chain of custody record.

Enviro-Chem appreciates the opportunity to provide you and your company this and other services. Please do not hesitate to call us if you have any questions.

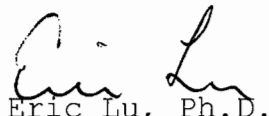

Sincerely,

Curtis Desilets
Vice President/Program Manger

Lab I.D.: **100317-84 through -142**

Dear Ms. Stout:

The **analytical results** for the soil and water samples, received by our lab on March 17, 2010, are attached. The samples were received chilled, intact and with chain of custody record.

Enviro-Chem appreciates the opportunity to provide you and your company this and other services. Please do not hesitate to call us if you have any questions.

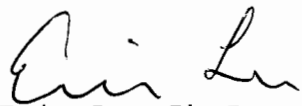

Sincerely,

Curtis Desilets

Project: **I-15 CIP ADL Survey**
Project No.: **603008001**
Lab I.D.: **100318-24 through -85**

Dear Ms. Stout:

The **analytical results** for the soil and water samples, received by our lab on March 18, 2010, are attached. The samples were received chilled, intact and with chain of custody record.

Enviro-Chem appreciates the opportunity to provide you and your company this and other services. Please do not hesitate to call us if you have any questions.

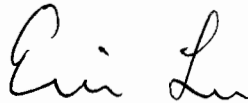

Sincerely,

Curtis Desilets

PROJECT: I-15 CIP ADL Survey PROJECT No.: 603008001
MATRIX: SOIL DATE RECEIVED: 03/18/10
SAMPLING DATE: 03/17/10 DATE ANALYZED: 03/19/10
REPORT TO: MS. KRISTIN STOUT DATE REPORTED: 03/25/10

EPA 6010B FOR TTLC-LEAD; PAGE 4 OF 4
UNITS: mg/Kg = MILLIGRAM PER KILOGRAM = PPM

Table with 4 columns: SAMPLE I.D., LAB I.D., TTLC-LEAD RESULT, DF. Rows include sample IDs like C0185-2.5, C0185-5.0, etc., with results ranging from 12.9 to ND.

PQL 0.50

COMMENTS:

DF = Dilution Factor
PQL = Practical Quantitation Limit
Actual Detection Limit = DF X PQL
ND = Non-Detected or below the Actual Detection Limit
TTLC = Total Threshold Limit Concentration
STLC = Soluble Threshold Limit Concentration
STLC Limit for lead = 5 PPM
* = STLC analysis is recommended (if marked)
*** = The concentration exceeds the TTLC Limit @ 1000 PPM, therefore the sample is defined as hazardous waste as per CCR-TITLE 22 (if marked)

Data Reviewed and Approved by: [Signature]
CAL-DHS ELAP CERTIFICATE No.: 1555

Lab I.D.: **100318-86 through -144**

Dear Ms. Stout:

The **analytical results** for the soil and water samples, received by our lab on March 18, 2010, are attached. The samples were received chilled, intact and with chain of custody record.

Enviro-Chem appreciates the opportunity to provide you and your company this and other services. Please do not hesitate to call us if you have any questions.

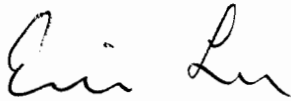

Sincerely,

Curtis Desilets

REPORT TO: MS. KRISTIN STOUT DATE REPORTED: 03/31/10

EPA 6010B FOR TTLC-LEAD; PAGE 1 OF 4
UNITS: mg/Kg = MILLIGRAM PER KILOGRAM = PPM

Table with 4 columns: SAMPLE I.D., LAB I.D., TTLC-LEAD RESULT, DF. Rows include D0361-0.5 (15.6), D0361-1.0 (1.60), Method Blank (ND), and PQL (0.50).

COMMENTS:

DF = Dilution Factor
PQL = Practical Quantitation Limit
Actual Detection Limit = DF X PQL
ND = Non-Detected or below the Actual Detection Limit
TTLC = Total Threshold Limit Concentration
STLC = Soluble Threshold Limit Concentration
STLC Limit for lead = 5 PPM
* = STLC analysis is recommended (if marked)
*** = The concentration exceeds the TTLC Limit @ 1000 PPM, therefore the sample is defined as hazardous waste as per CCR-TITLE 22 (if marked)

Limited Asbestos and Lead Chip Assessment
Campbell Ranch Road
Corona, California 92883

May 4, 2020

HDR Engineering, Inc.
2280 Market Street, Suite 100
Riverside, California 92501

Attn: Mr. Mark Hager

Re: Interstate 15 Express Lanes Project Southern Extension
Lake Elsinore to Corona and Unincorporated Riverside County, California 92883

Pursuant to your request, A-Tech Consulting, Inc. (A-Tech) completed a Limited Asbestos and Lead Chip Assessment associated with the Interstate 15 (I-15) Express Lanes Project Southern Extension (ELPSE) in Lake Elsinore, Corona and the Unincorporated Riverside County, California.

1.0 INTRODUCTION

The I-15 ELPSE project proposes to increase capacity by adding two tolled express lanes in both directions within the I-15 median to accommodate increasing traffic volumes in western Riverside County. Associated improvements, including advance signage and transition striping, would extend two miles from each end of the project limits to Postmile 20.3 in the south and Postmile 38.8 in the north.

This report presents the results for the Limited Asbestos and Lead Chip Assessment for the I-15 ELPSE (Subject Property), in Lake Elsinore, Corona and the Unincorporated Riverside County, California. The hazardous materials sampling was conducted by Hugo Good – CSST #16-5643 and CDPH Sampling Technician #27136 on January 6 to January 10, on January 13, from January 22 to January 23, from January 27 to January 31, and from February 4 to February 7, 2020. This report does not represent a HUD level inspection. This report is not intended to be a comprehensive assessment.

The inspector who conducted the site sampling/assessment is a state certified California Department of Public Health (CDPH) Sampling Technician and has completed an EPA-sponsored curriculum in the Lead Sampling Technician Training. At the time of this report, the CDPH, Childhood Lead Poisoning Branch, has implemented a State Certification and Model Accreditation Plan adopted from the EPA.

This Limited Asbestos and Lead Assessment was conducted in accordance with the Scope of Services authorized by Mr. Mark Hager with HDR Engineering, Inc. in accordance with current regulatory guidelines. All sampling was conducted at the direction of Mr. Mark Hager and was limited to the areas and materials with the potential for impact (concrete inside/outside barrier, lanes and under decking of bridge) during the upcoming I-15 ELPSE. This includes the inside and outside rails for both Northbound and Southbound directions of all bridges and overpasses related to this project.

2.0 SCOPE OF ASSESSMENT

During the PS&E Phase, RCTC will ensure that an ACM and LBP survey will be conducted for any structure requiring modification or removal. The RCTC will ensure that the survey will be conducted in conformance with the U.S. EPA National Emission Standards for Hazardous Air Pollutants (NESHAP) 40 CFR, SCAQMD Rule 1403, and in accordance with Caltrans SSP 14-11.13, Disturbance of Existing Paint Systems on Bridges, and Caltrans SSP 14-11.16, Asbestos-Containing Construction Materials in Bridges.

Asbestos

As a limited asbestos assessment, this work was performed to identify visible and/or readily accessible suspect friable and non-friable Asbestos-Containing Materials (ACMs) at the Subject Property. The intent of this assessment was to satisfy all regulatory requirements for renovation and/or demolition. Friable ACM, as defined by the United States Environmental Protection Agency (EPA) and South Coast Air Quality Management District (SCAQMD), Rule 1403, is a material that, when dry, can be easily pulverized, crushed or reduced to powder by hand pressure. Non-friable ACM that can potentially be broken, crumbled, pulverized or reduced to powder in the course of demolition or renovation activities and are classified as Category I or Category II, non-friable ACM. These assessments are typically accomplished by, and limited to, an in-depth site reconnaissance, a review of readily available building records, and a review of readily available asbestos Operation and Maintenance (O&M) plans. In the event that suspected or known ACMs exist at a given site, samples of the potential ACMs may be collected for subsequent laboratory analysis.

This inspection was limited to representative locations in the Subject Property Area that may be affected by the renovation activities. Limited intrusive and/or non-destructive sampling was conducted as a part of the scope of services performed. If additional suspect materials are observed by the contractor, abatement contractor, building owner and/or its representatives, A-Tech should be notified to conduct additional testing. Certain materials may not have been visible/accessible during the initial assessment such as subsurface materials, live electrical equipment, materials in pipe chases and materials under the bridge structure, etc.

Lead

The limited inspection was performed in accordance with United States Environmental Protection Agency (EPA) and the California Division of Occupational Safety and Health Administration (Cal/OSHA) requirements, utilizing United States Department of Housing and Urban Development (HUD) protocols. The purpose of this Lead Containing Material (LCM) inspection is to identify and assess the LCM present at the Subject Property with the potential for impact during upcoming renovation/demolition activities.

The intent was to ascertain the presence of LCM above the specified level for objective data (600 PPM) established by Cal/OSHA. If LCM was found, the inspection would identify individual architectural components and their respective concentrations of lead in such a manner that this report would be used as a basis for the subsequent stabilization and/or abatement activity.

3.0 SITE DESCRIPTION

The project work area included approximately a total of 15 miles of bridges on both the Northbound and Southbound sides of the I-15, between Nichols Road and Cajalco Road (between Lake Elsinore and Corona), this includes both the inside and outside rails at 15 bridge locations. A metal guard rail barrier fastened to concrete walls support is present along the inside portions of the bridges Weirick Road Undercrossing to Brown Canyon Wash on both the Northbound and Southbound sides of I-15. A black pavement sealer was applied at the concrete to asphalt seam on both ends of both bridges, and a black adhesive is present beneath the reflectors on both sides of the interstate. Yellow striping is present on the inside median lane demarcation on both sides of the interstate. While white striping is present on the outside median lane demarcation on both sides of the interstate. There were no suspect utility finishes, such as wire wrap or pipe insulation, observed within the project areas.

The Subject Property inspected consists of fifteen freeway bridges that span from Lake Elsinore to Corona. A detailed description of each bridge follows:

<u>Postmile</u>	<u>Structure Name</u>	<u>Location</u>
25.55	56-0726L/R – Gavilan Wash	Lake Elsinore
26.69	56-0682L/R – Lake Street Undercrossing	Lake Elsinore
27.78	56-0681L/R – Temescal Canyon Road Overhead	Lake Elsinore
28.04	56-0680L/R – Temescal Wash	Corona
28.87	56-0679L/R – Horsethief Canyon Road Undercrossing	Corona

<u>Postmile</u>	<u>Structure Name</u>	<u>Location</u>
29.13	56-0678L/R – Horsethief Canyon Wash	Corona
30.09	56-0677L/R - Indian Wash	Corona
30.4	56-0676L/R - Indian Truck Trail Undercrossing	Corona
31.9	56-0675L/R – Temescal Canyon Road Undercrossing	Corona
31.97	56-0675L/R – Mayhew Wash	Corona
32.96	56-0543L/R – Coldwater Wash	Corona
33.25	56-0542L/R – Temescal Canyon Road Undercrossing	Corona
34.72	56-0559L/R – Brown Canyon Wash	Corona
35.64	56-0541L/R – Weirick Road Undercrossing	Corona
36.58	56-0540L/R – Bedford Wash	Corona

4.0 VISUAL INSPECTION AND SAMPLING/ANALYTICAL METHODOLOGY

Asbestos

Visual Inspection

To identify suspect friable and non-friable ACM, as required under California law, a California Division of Occupational Safety Health Administration (Cal/OSHA), Certified Site Surveillance Technicians (CSST) and/or Certified Asbestos Consultant (CAC) is required to conduct visual and/or bulk assessments of a Subject Property.

During this assessment, A-Tech identified homogeneous areas of suspected ACMs and assessed the condition and estimated quantity for the purpose of sampling in accordance with current Cal/OSHA /EPA Asbestos Hazard Emergency Response Act (AHERA) requirements. These areas were defined with respect to similarities in appearance, age, use, type, color, and/or texture. Based upon A-Tech's observations, two hundred and thirty-three (233) homogeneous suspect asbestos containing materials were identified. Please refer to Appendix A for a complete list of sampled materials.

Sampling Procedure/Analytical Methodology

To evaluate the presence of asbestos in these suspected ACMs, A-Tech obtained six hundred and fifty-three (653) bulk samples, which appeared to represent each homogeneous area (see tables). However, some of the samples analyzed may have multiple layers of material, which the laboratory is required to separate and analyze independently. The total amount of samples analyzed was seven hundred and fifty-eight (758). Regarding multiple layered materials, if one layer tests positive for asbestos content, the entire sample is considered positive.

Materials containing greater than one-tenth of one percent (>0.1%) asbestos by weight is considered positive in this report and defined as asbestos containing construction material (ACCM), and anything >1% is an asbestos containing material.

Following AHERA inspection methodology, the inspector identifies each suspect material and categorizes it into one of three established material types: surfacing, thermal system or miscellaneous (See attached table: Asbestos Bulk Sample Analysis for individual sample identification). The following describes the characteristics for these three categories:

- *Surfacing material* - means material in a building that is sprayed on, troweled on, or otherwise applied to surfaces such as acoustical plaster on ceilings, fireproofing materials on structural members, or other materials on surfaces for acoustical, fireproofing, or other purposes.
- *Thermal system insulation* - means material in a building applied to pipes, fittings, boilers, breeching, tanks, ducts, or other interior structural components to prevent heat loss or gain, or water condensation, or for other purposes.
- *Miscellaneous material* - means interior building material on structural components, structural members or fixtures, such as floor and ceiling tiles, and does not include surfacing material or thermal system insulation.

After collecting each sample, the sampling equipment was cleaned with a moist towelette. Each sample was sealed in a sample container and assigned a discrete sample identification number.

Lead

Visual Inspection

A visual inspection consisting of a walkthrough of the Subject Property was conducted to determine the presence of suspect LCM components that were readily accessible and/or exposed. This included the identification of suspect lead-based painted components, etc., and the determination of the condition of those components. All coated surfaces, including but not limited to, painted surfaces, were tested for lead content.

Sampling Procedure/Analytical Methodology

Sampling was conducted at the Subject Property by collecting specific paint chip or bulk samples, which represented each specific suspect lead material, paint type and substrate. Samples were placed in a conical or double bag container and assigned a discrete sample identification number. The sample collection tool was cleaned between each sample. The sample collection was conducted in accordance with HUD and EPA guidelines. Care was taken not to include substrate in the samples collected.

Samples represent all materials that are similar (homogenous). If a testing combination is found positive in one location, it is presumed to be positive in all other locations. Therefore, you cannot continue sampling to rebut an original positive finding, unless there is plausible evidence that the suspected material was constructed and/or replaced at a later time.

CDPH and HUD defines lead-based paint (LBP) as paints containing equal to or greater than 1.0 mg/cm², 0.5% lead by weight or 5,000 milligrams per kilogram (mg/kg) or parts per million (ppm) total lead. Cal/OSHA's current level for objective data/negative determination is 600 ppm. However, anyone performing trigger tasks, regardless of the level of lead, as outlined in 29 CFR 1926.62 and Title 8 CCR 1532.1 can reasonably assume risk of lead exposure. Examples of trigger tasks include sanding/abrading lead-based paint and/or lead containing materials. Work activities, which may lead to any amount of lead exposure, must be conducted in accordance with safe lead work practices, current regulatory guidelines, and current proper protective equipment protocols.

5.0 LABORATORY ACCREDITATION AND ANALYTICAL PROCEDURES

Asbestos

The six hundred and fifty-three (653) samples obtained from the Subject Property were delivered for analysis to Aerobiology Laboratory Associates, Inc. of Huntington Beach, California at (714) 895-8401 and Aerobiology Laboratory Associates, Inc. of Golden, Colorado at (302) 232-3746, following chain-of-custody procedures. These laboratories are fully accredited laboratories by the National Institute of Standards and Technology (NIST) through participation in the National Voluntary Laboratory Accreditation Program (NVLAP) lab code #500079-0 and lab code #200860-0, respectively.

The samples were analyzed for asbestos by Polarized Light Microscopy (PLM), using dispersion staining in accordance with U.S. EPA Procedures outlined in 40 CFR 763, Subpart F, Appendix A (AHERA). Utilizing the PLM 600R/R-93/116 method, the result given is a semi-quantitative result (down to <1%) which reflects a calibrated visual estimate from an analyst using both PLM and Stereomicroscopy.

Lead

The two hundred and twenty-six (226) samples obtained from the Subject Property were delivered for analysis to AIH Laboratory of Anaheim, California at (562) 860-2201, following chain-of-custody procedures. AIH Laboratory of Anaheim is a fully accredited laboratory by the CDPH, Environmental Laboratory Accreditation Program and certified by the National Lead Laboratory Accreditation Program (NLLAP).

The samples were analyzed for lead content by Flame Atomic Absorption Spectrometry (AAS) using EPA Methods SW-846 3050B/7000B.

6.0 RESULTS

Asbestos

Based upon the analytical results, asbestos is present in eighteen (18) of the six hundred and fifty-three (653) samples analyzed. All of these samples were considered to be non-friable materials and were obtained from the gray felt pad.

Based upon the analytical results, asbestos is present in the following material:

<u>Sample Number</u>	<u>Material</u>	<u>Sample Locations</u>	<u>Asbestos Type - Percentage</u>	<u>Friability</u>	<u>Est. Qty.</u>
192661-A-0468	Gray Felt Pad	56-0540L – Southbound Bedford Wash, Inner Guard Rail	Chrysotile - 55 %	Non-Friable	6 SF
192661-A-0469	Gray Felt Pad	56-0540L – Southbound Bedford Wash, Inner Guard Rail	Chrysotile - 50 %	Non-Friable	See 468
192661-A-0470	Gray Felt Pad	56-0540L – Southbound Bedford Wash, Inner Guard Rail	Chrysotile - 50 %	Non-Friable	See 468
192661-A-0482	Gray Felt Pad	56-0541L – Southbound Weirick Road Undercrossing, Inner Guard Rail	Chrysotile - 60 %	Non-Friable	6 SF
192661-A-0483	Gray Felt Pad	56-0541L – Southbound Weirick Road Undercrossing, Inner Guard Rail	Chrysotile - 55 %	Non-Friable	See 482
192661-A-0484	Gray Felt Pad	56-0541L – Southbound Weirick Road Undercrossing, Inner Guard Rail	Chrysotile - 50 %	Non-Friable	See 482
192661-A-0493	Gray Felt Pad	56-0559L – Southbound Brown Canyon Wash, Inner Guard Rail	Chrysotile - 25 %	Non-Friable	6 SF
192661-A-0494	Gray Felt Pad	56-0559L – Southbound Brown Canyon Wash, Inner Guard Rail	Chrysotile - 25 %	Non-Friable	See 493
192661-A-0495	Gray Felt Pad	56-0559L – Southbound Brown Canyon Wash, Inner Guard Rail	Chrysotile - 25 %	Non-Friable	See 493
192661-A-0624	Gray Felt Pad	56-0559R – Northbound Brown Canyon Wash, Inner Guard Rail	Chrysotile - 25 %	Non-Friable	6 SF
192661-A-0625	Gray Felt Pad	56-0559R – Northbound Brown Canyon Wash, Inner Guard Rail	Chrysotile - 25 %	Non-Friable	See 624
192661-A-0626	Gray Felt Pad	56-0559R – Northbound Brown Canyon Wash, Inner Guard Rail	Chrysotile - 25 %	Non-Friable	See 624
192661-A-0639	Gray Felt Pad	56-0541R – Northbound Weirick Road Undercrossing, Inner Guard Rail	Chrysotile - 40 %	Non-Friable	6 SF
192661-A-0640	Gray Felt Pad	56-0541R – Northbound Weirick Road Undercrossing, Inner Guard Rail	Chrysotile - 40 %	Non-Friable	See 639
192661-A-0641	Gray Felt Pad	56-0541R – Northbound Weirick Road Undercrossing, Inner Guard Rail	Chrysotile - 45 %	Non-Friable	See 639
192661-A-0645	Gray Felt Pad	56-0540R – Northbound Bedford Wash, Inner Guard Rail	Chrysotile - 45 %	Non-Friable	6 SF
192661-A-0646	Gray Felt Pad	56-0540R – Northbound Bedford Wash, Inner Guard Rail	Chrysotile - 45 %	Non-Friable	See 645
192661-A-0647	Gray Felt Pad	56-0540R – Northbound Bedford Wash, Inner Guard Rail	Chrysotile - 45 %	Non-Friable	See 645

Please refer to Appendix A: Tables: Asbestos Bulk Sample Analysis for detailed sample information.

The homogenous locations for the material containing asbestos are as follows:

<u>Materials</u>	<u>Material Locations</u>
Gray Felt Pad	56-0540L - Southbound Bedford Wash
Gray Felt Pad	56-0541L - Southbound Weirick Road Undercrossing
Gray Felt Pad	56-0559L - Southbound Brown Canyon Wash
Gray Felt Pad	56-0559R - Northbound Brown Canyon Wash
Gray Felt Pad	56-0541R - Northbound Weirick Road Undercrossing
Gray Felt Pad	56-0540R - Northbound Bedford Wash

Lead

Based on the laboratory analytical results, the following materials contained lead content greater than 600 ppm:

<u>Sample Number</u>	<u>Area</u>	<u>Component</u>	<u>Side</u>	<u>Color</u>	<u>Substrate</u>	<u>Cond.</u>	<u>Results PPM</u>	<u>Est. Qty.</u>
192661-L-0189	56-0680R – Northbound Temescal Wash, Inside Rail	Rail	D	Light Gray	Concrete	Intact	883	60 SF
192661-L-0200	56-0677R – Northbound Indian Wash, Inside Rail	Lane Surface Paint	-	Yellow	Concrete	Intact	12,587	125 SF

Please refer to Appendix B: Tables: Lead Paint Chip Sample Analysis for detailed sample information.

7.0 CONCLUSIONS AND RECOMMENDATIONS

Asbestos

The results of this limited assessment indicate that ACM are present at the Subject Property and may be impacted by the proposed construction activities. Asbestos was present in the gray felt pad at Bedford Wash Postmile 36.58, Weirick Road Undercrossing Postmile 35.64 and Brown Canyon Wash Postmile 34.72 at 25-60% Chrysotile. These materials are further described in the Appendix A: Tables: Asbestos Bulk Sample Analysis. It appears that some or all of these materials will be impacted by the I-15 ELPSE.

Prior to renovation, specifications should be properly modified to incorporate the removal of ACM. If removal of ACM is required in connection with demolition, such work should only be performed by personnel who are appropriately trained, experienced, and registered. Intentional disturbance of ACM should be performed in a manner such that emissions are controlled. Control measures should include, but not be limited to:

- wet methods
- encapsulation
- removal with HEPA-filter equipped vacuums
- appropriately labeled polyethylene bags

CAL/OSHA must be notified a minimum of 24 hours prior to the start of any asbestos-abatement project. The local National Emission Standards for Hazardous Air Pollutants (NESHAP) regulatory agency as listed below must be notified 10 working days prior to the start of any demolition or asbestos abatement projects which exceed 100 square feet or 120 linear feet of asbestos-containing material. This project is within the jurisdiction of the SCAQMD, Rule 1403.

Air monitoring relating to such work should be performed by or under the direct supervision of a California State Certified Asbestos Consultant before, during, and after the abatement work, as required by EPA and other regulations.

There are potential liabilities associated with the presence, and removal of ACM. Precautionary measures, as outlined herein, should be taken in accordance with the guidelines set forth by the EPA, Cal/OSHA and other regulatory agencies.

If any further suspect asbestos containing materials are discovered and are to be impacted as part of the renovation activities, they must be sampled for asbestos content prior to being impacted.

Lead

There were two paints/coatings samples identified at the Subject Property with lead content sufficient to be categorized as LBP. The light gray paint on the rail at the Northbound Temescal Wash Postmile 28.04 and the yellow lane surface paint at the Northbound Indian Wash Postmile 30.09 were detected well above the Cal/OSHA 600 ppm level for determining LBP. These materials are further described in the Appendix B: Tables: Lead Paint Chip Sample Analysis. It appears that some or all of these materials will be impacted by the I-15 ELPSE.

Lead is a hazardous substance and poses a health risk when impacted, damaged or sufficiently deteriorated to produce respirable/digestible dust. If lead-based/containing components are to be impacted during work activities including, but not limited to, sanding, chipping, demolition, renovation, and/or construction, specifications should incorporate detailed methodology for proper stabilization and/or removal of the lead surfaces.

For any materials that will remain in place, a Lead Management Program should be prepared and implemented to avoid incidental and/or accidental disturbance of LCM present at the subject site. The program should set forth operational and maintenance guidelines to minimize lead consumption or exposures that may be caused by age, normal wear and tear, delamination, building maintenance, repairs, renovation and other activities that may impact LCM. Further assessments should be scheduled with a licensed Risk Assessor/Inspector on an annual basis, to ensure LCM conditions remain stable. Any signs of paint deterioration should be immediately stabilized. Any work activities that may exceed the Cal/OSHA action level of lead particles of 30 micrograms per cubic meter (ug/m³) or air for an eight-hour time weighted average must comply with Cal/OSHA requirements. Any work activities meeting or exceeding the Cal/OSHA Permissible Exposure Limit of exposure to lead particles of ug/m³ of air shall comply with Title 8 CCR 1532.1-Lead Construction Standard. All workers and supervisors shall be trained by a state-accredited training provider and certified by the CDPH (worker or supervisor certified). All employee exposure monitoring must be adhered to in accordance with Cal/OSHA requirements.

8.0 LIMITATIONS

Purpose and Use of Report

The conclusions presented in this report are professional opinions based solely upon visual observations at the Subject Property and laboratory analysis of the tested samples. They are intended exclusively for the purpose outlined herein, and for the Subject Property location and project indicated.

This assessment report is not intended as specifications for asbestos and/or lead abatement and it should not be used as a stand-alone asbestos or lead abatement bid document. Recognizing that even the most comprehensive assessment may fail to detect ACMs or LCMs at a particular site, this study was not intended to identify all potential ACMs or LCMs present at the Subject Property for such reasons as the possible existence of buried, covered and inaccessible areas and features. A-Tech does not warrant that all sub-surface, bridge cavity or other inaccessible materials were tested. A-Tech did not test any live electrical components. These components may contain untested suspect ACMs or LCMs. If any suspect ACMs or LCMs not tested herein are discovered, they must be tested prior to impact.

This report is intended for the sole use of the contracted client and its authorized representatives. The exchange of information was unique between A-Tech and the client regarding the mutually agreed upon Scope of Service. Unless explicitly authorized in this report, no third party is beneficiary to the contract or findings of this report. The unauthorized use or reliance of this document or the findings, conclusion or recommendations presented herein, by any other party or parties is at the sole risk of any such third party. For the same reasons, no warranties or representations, expressed or implied in this report, are provided to any such third party.

Samples

This limited inspection was planned, developed, and implemented based on A-Tech's Scope of Services provided by the client. This limited inspection was conducted in compliance with current regulatory protocols. A-Tech utilized state-of-the-art-practices and techniques in accordance with regulatory standards, while performing this limited inspection. A-Tech's evaluation of the relative risk of exposure to asbestos and lead, identified during this limited inspection, is based on conditions observed at the time of the limited inspection.

Samples were collected from materials of similar appearance, age, use, type, color and/or texture. However, this does not guarantee that they are of the same composition. A-Tech cannot be responsible for changing conditions that may alter the relative lead exposure risk or for future changes in accepted lead sampling methodology. The floor plans and actual test results for each of the tested areas are contained within this report. No guarantee is expressed or implied that all ACMs or LCMs have been identified. **Asbestos and Lead quantities are estimates only (see Appendix A: Tables: Asbestos Bulk Sample Analysis and Appendix B: Tables: Lead Paint Chip Sample Analysis for Estimated Quantity). Exact quantities should be verified by the abatement contractor prior to removal.**

Exclusion

A-Tech assumes no responsibility for the identification of suspect ACMs or LCMs, which were not included in the client's Scope of Service or were concealed and/or inaccessible (i.e. bridge cavities, wood framing, metal rods in columns, etc.) However, A-Tech makes every attempt possible to test all designated areas for lead (i.e. check between bridge and banking, bridge deck, between railings and concrete dividers, etc.). However, A-Tech makes every attempt possible to inspect all designated areas for suspect ACMs or LCMs.

There are potential liabilities associated with the presence, and removal, of LCM. Precautionary measures, as outlined herein, should be taken in accordance with the guidelines set forth by the EPA, Cal/OSHA and other regulatory agencies.

Services performed by A-Tech were conducted in a manner above the care and skill ordinarily and currently exercised by members of the same profession that even the most comprehensive scope of services might fail to detect environmental liabilities on a particular site. Therefore, A-Tech cannot act as insurers and cannot "certify" that a site is free of environmental contamination.

Warranty

No expressed or implied representation or warranty is included or intended in our reports, except that our services were performed, within the limits prescribed by the Scope of Services, with the customary thoroughness and competence of our profession.

Information and opinions presented herein apply to the existing and reasonable foreseeable Subject Property conditions at the time of our investigation. They cannot necessarily apply to Subject Property changes of which this office is unaware and have not had the opportunity to review. Changes in the conditions of this property may occur with time due to natural processes or works of man on the subject property or on adjacent properties. Changes in applicable standards may also occur as a result of legislation or the broadening of knowledge. Accordingly, the findings of this report may be invalidated, wholly or in part by changes beyond our control.

A-Tech trusts that the information presented herein provides the data you require. Should you have any questions or comments please contact A-Tech Consulting, Inc. at (800) 434-1025.

Respectfully submitted,
A-Tech Consulting, Inc.

Robert L. Williams, DPH, CAC, CIEC
Certified Asbestos Consultant #96-1980

General Notes

- **ND** indicates no asbestos was detected; the method detection limit is 1%.
- **Trace** or "<1" indicates asbestos was identified in the sample, but the concentration is less than the method detection limit of 1%.
- All regulated asbestos minerals (i.e. chrysotile, amosite, crocidolite, anthophyllite, tremolite, and actinolite) were sought in every layer of each sample, but only those asbestos minerals detected are listed. Amosite is the common name for the asbestiform variety of the minerals cummingtonite and grunerite. Crocidolite is the common name used for the asbestiform variety of the mineral riebeckite.
- Tile, vinyl, foam, plastic, and fine powder samples may contain asbestos fibers of such small diameter (< 0.25 microns in diameter) that these fibers cannot be detected by PLM. For such samples, more sensitive analytical methods (e.g. TEM, SEM, and XRD) are recommended if greater certainty about asbestos content is required. Semi-quantitative bulk TEM floor tile analysis is accepted under the NESHAP regulations.
- These results are submitted pursuant to Aerobiology Laboratory Associates, Inc.'s current terms and conditions of sale, including the company's standard warranty and limitation of liability provisions. No responsibility or liability is assumed for the manner in which the results are used or interpreted.
- Unless notified in writing to return the samples covered by this report, Aerobiology Laboratory Associates, Inc. will store the samples for a minimum period of thirty (30) days before discarding. A shipping and handling charge will be assessed for the return of any samples.
- Samples identified as inhomogeneous (containing more than one layer) shall be divided into individual layers and each layer tested separately. The results for each individual layer shall be listed separately on the report.

Notes Required by NVLAP

- This report must not be used by the client to claim product certification, approval, or endorsement by NVLAP, NIST, or any agency of the Federal Government.
- This test report relates only to the items tested or calibrated.
- This report is not valid unless it bears the name of a NVLAP-approved signatory.
- Any reproduction of this document must include the entire document in order for the report to be valid.

Total Layers Analyzed: 62

Test Requested: **3002, Asbestos in Bulk Samples**
Method: EPA/600/R-93/116: Method for the Determination of Asbestos in Bulk Building Materials; EPA-600/M4-82-020: Interim Method for the Determination of Asbestos in Bulk Insulation Samples

General Notes

- **ND** indicates no asbestos was detected; the method detection limit is 1 %.
- **Trace** or "< 1" indicates asbestos was identified in the sample, but the concentration is less than 1% and cannot be quantified without point counting.
- Samples identified as inhomogeneous (more than one layer) are separated into individual layers, and each layer is analyzed and reported separately.
- All regulated asbestos minerals (i.e. chrysotile, amosite, crocidolite, anthophyllite, tremolite, and actinolite) were sought in every layer of each sample, but only those asbestos minerals detected are listed. Amosite is the common name for the asbestiform variety of the minerals cummingtonite and grunerite. Crocidolite is the common name used for the asbestiform variety of the mineral riebeckite.
- Tile, vinyl, foam, plastic, and fine powder samples may contain asbestos fibers of such small diameter (< 0.25 microns in diameter) that these fibers cannot be detected by PLM. For such samples, more sensitive analytical methods (e.g. TEM, SEM, and XRD) are recommended if greater certainty about asbestos content is required. Semi-quantitative bulk TEM floor tile analysis is accepted under NESHAP regulations.
- These results are submitted pursuant to Aerobiology Laboratory Associates, Inc.'s current terms and conditions of sale, including the company's standard warranty and limitation of liability provisions. No responsibility or liability is assumed for the manner in which the results are used or interpreted.
- Unless notified in writing to return the samples covered by this report, Aerobiology Laboratory Associates, Inc. will store the samples for a minimum period of thirty (30) days before discarding. A shipping and handling charge will be assessed for the return of any samples.
- Aerobiology does not guarantee the results of tape lifts, microvacs, wipe, and/or debris samples. Accurate analysis cannot be performed due to particle size, media used, and/or amount of material given. Analysis of these materials should be performed by a TEM. ***A result of ND does not indicate that the sample area does not contain asbestos. It means the analyst could not identify asbestos in the specific sample for the reasons listed above.***

Notes Required by NVLAP

- This report must not be used by the client to claim product certification, approval, or endorsement by NVLAP, NIST, or any agency of the Federal Government.
- This test report relates only to the items tested or calibrated.
- This report is not valid unless it bears the name of a NVLAP-approved signatory.
- Any reproduction of this document must include the entire document in order for the report to be valid.

General Notes

- **ND** indicates no asbestos was detected; the method detection limit is 1%.
- **Trace** or "<1" indicates asbestos was identified in the sample, but the concentration is less than the method detection limit of 1%.
- All regulated asbestos minerals (i.e. chrysotile, amosite, crocidolite, anthophyllite, tremolite, and actinolite) were sought in every layer of each sample, but only those asbestos minerals detected are listed. Amosite is the common name for the asbestiform variety of the minerals cummingtonite and grunerite. Crocidolite is the common name used for the asbestiform variety of the mineral riebeckite.
- Tile, vinyl, foam, plastic, and fine powder samples may contain asbestos fibers of such small diameter (< 0.25 microns in diameter) that these fibers cannot be detected by PLM. For such samples, more sensitive analytical methods (e.g. TEM, SEM, and XRD) are recommended if greater certainty about asbestos content is required. Semi-quantitative bulk TEM floor tile analysis is accepted under the NESHAP regulations.
- These results are submitted pursuant to Aerobiology Laboratory Associates, Inc.'s current terms and conditions of sale, including the company's standard warranty and limitation of liability provisions. No responsibility or liability is assumed for the manner in which the results are used or interpreted.
- Unless notified in writing to return the samples covered by this report, Aerobiology Laboratory Associates, Inc. will store the samples for a minimum period of thirty (30) days before discarding. A shipping and handling charge will be assessed for the return of any samples.
- Samples identified as inhomogeneous (containing more than one layer) shall be divided into individual layers and each layer tested separately. The results for each individual layer shall be listed separately on the report.

Notes Required by NVLAP

- This report must not be used by the client to claim product certification, approval, or endorsement by NVLAP, NIST, or any agency of the Federal Government.
- This test report relates only to the items tested or calibrated.
- This report is not valid unless it bears the name of a NVLAP-approved signatory.
- Any reproduction of this document must include the entire document in order for the report to be valid. Total Layers Analyzed: 116

Method: EPA/600/R-93/116: Method for the Determination of Asbestos in Bulk Building Materials; EPA-600/M4-82-020: Interim Method for the Determination of Asbestos in Bulk Insulation Samples

General Notes

- **ND** indicates no asbestos was detected; the method detection limit is 1 %.
- **Trace** or "< 1" indicates asbestos was identified in the sample, but the concentration is less than 1% and cannot be quantified without point counting.
- Samples identified as inhomogeneous (more than one layer) are separated into individual layers, and each layer is analyzed and reported separately.
- All regulated asbestos minerals (i.e. chrysotile, amosite, crocidolite, anthophyllite, tremolite, and actinolite) were sought in every layer of each sample, but only those asbestos minerals detected are listed. Amosite is the common name for the asbestiform variety of the minerals cummingtonite and grunerite. Crocidolite is the common name used for the asbestiform variety of the mineral riebeckite.
- Tile, vinyl, foam, plastic, and fine powder samples may contain asbestos fibers of such small diameter (< 0.25 microns in diameter) that these fibers cannot be detected by PLM. For such samples, more sensitive analytical methods (e.g. TEM, SEM, and XRD) are recommended if greater certainty about asbestos content is required. Semi-quantitative bulk TEM floor tile analysis is accepted under NESHAP regulations.
- These results are submitted pursuant to Aerobiology Laboratory Associates, Inc.'s current terms and conditions of sale, including the company's standard warranty and limitation of liability provisions. No responsibility or liability is assumed for the manner in which the results are used or interpreted.
- Unless notified in writing to return the samples covered by this report, Aerobiology Laboratory Associates, Inc. will store the samples for a minimum period of thirty (30) days before discarding. A shipping and handling charge will be assessed for the return of any samples.
- Aerobiology does not guarantee the results of tape lifts, microvacs, wipe, and/or debris samples. Accurate analysis cannot be performed due to particle size, media used, and/or amount of material given. Analysis of these materials should be performed by a TEM. ***A result of ND does not indicate that the sample area does not contain asbestos. It means the analyst could not identify asbestos in the specific sample for the reasons listed above.***

Notes Required by NVLAP

- This report must not be used by the client to claim product certification, approval, or endorsement by NVLAP, NIST, or any agency of the Federal Government.
- This test report relates only to the items tested or calibrated.
- This report is not valid unless it bears the name of a NVLAP-approved signatory.
- Any reproduction of this document must include the entire document in order for the report to be valid.

Method: EPA/600/R-93/116: Method for the Determination of Asbestos in Bulk Building Materials; EPA-600/M4-82-020: Interim Method for the Determination of Asbestos in Bulk Insulation Samples

General Notes

- **ND** indicates no asbestos was detected; the method detection limit is 1 %.
- **Trace** or "< 1" indicates asbestos was identified in the sample, but the concentration is less than 1% and cannot be quantified without point counting.
- Samples identified as inhomogeneous (more than one layer) are separated into individual layers, and each layer is analyzed and reported separately.
- All regulated asbestos minerals (i.e. chrysotile, amosite, crocidolite, anthophyllite, tremolite, and actinolite) were sought in every layer of each sample, but only those asbestos minerals detected are listed. Amosite is the common name for the asbestiform variety of the minerals cummingtonite and grunerite. Crocidolite is the common name used for the asbestiform variety of the mineral riebeckite.
- Tile, vinyl, foam, plastic, and fine powder samples may contain asbestos fibers of such small diameter (< 0.25 microns in diameter) that these fibers cannot be detected by PLM. For such samples, more sensitive analytical methods (e.g. TEM, SEM, and XRD) are recommended if greater certainty about asbestos content is required. Semi-quantitative bulk TEM floor tile analysis is accepted under NESHAP regulations.
- These results are submitted pursuant to Aerobiology Laboratory Associates, Inc.'s current terms and conditions of sale, including the company's standard warranty and limitation of liability provisions. No responsibility or liability is assumed for the manner in which the results are used or interpreted.
- Unless notified in writing to return the samples covered by this report, Aerobiology Laboratory Associates, Inc. will store the samples for a minimum period of thirty (30) days before discarding. A shipping and handling charge will be assessed for the return of any samples.
- Aerobiology does not guarantee the results of tape lifts, microvacs, wipe, and/or debris samples. Accurate analysis cannot be performed due to particle size, media used, and/or amount of material given. Analysis of these materials should be performed by a TEM. **A result of ND does not indicate that the sample area does not contain asbestos. It means the analyst could not identify asbestos in the specific sample for the reasons listed above.**

Notes Required by NVLAP

- This report must not be used by the client to claim product certification, approval, or endorsement by NVLAP, NIST, or any agency of the Federal Government.
- This test report relates only to the items tested or calibrated.
- This report is not valid unless it bears the name of a NVLAP-approved signatory.
- Any reproduction of this document must include the entire document in order for the report to be valid.

General Notes

- **ND** indicates no asbestos was detected; the method detection limit is 1 %.
- **Trace** or "< 1" indicates asbestos was identified in the sample, but the concentration is less than 1% and cannot be quantified without point counting.
- Samples identified as inhomogeneous (more than one layer) are separated into individual layers, and each layer is analyzed and reported separately.
- All regulated asbestos minerals (i.e. chrysotile, amosite, crocidolite, anthophyllite, tremolite, and actinolite) were sought in every layer of each sample, but only those asbestos minerals detected are listed. Amosite is the common name for the asbestiform variety of the minerals cummingtonite and grunerite. Crocidolite is the common name used for the asbestiform variety of the mineral riebeckite.
- Tile, vinyl, foam, plastic, and fine powder samples may contain asbestos fibers of such small diameter (< 0.25 microns in diameter) that these fibers cannot be detected by PLM. For such samples, more sensitive analytical methods (e.g. TEM, SEM, and XRD) are recommended if greater certainty about asbestos content is required. Semi-quantitative bulk TEM floor tile analysis is accepted under NESHAP regulations.
- These results are submitted pursuant to Aerobiology Laboratory Associates, Inc.'s current terms and conditions of sale, including the company's standard warranty and limitation of liability provisions. No responsibility or liability is assumed for the manner in which the results are used or interpreted.
- Unless notified in writing to return the samples covered by this report, Aerobiology Laboratory Associates, Inc. will store the samples for a minimum period of thirty (30) days before discarding. A shipping and handling charge will be assessed for the return of any samples.
- Aerobiology does not guarantee the results of tape lifts, microvacs, wipe, and/or debris samples. Accurate analysis cannot be performed due to particle size, media used, and/or amount of material given. Analysis of these materials should be performed by a TEM. ***A result of ND does not indicate that the sample area does not contain asbestos. It means the analyst could not identify asbestos in the specific sample for the reasons listed above.***

Notes Required by NVLAP

- This report must not be used by the client to claim product certification, approval, or endorsement by NVLAP, NIST, or any agency of the Federal Government.
- This test report relates only to the items tested or calibrated.
- This report is not valid unless it bears the name of a NVLAP-approved signatory.
- Any reproduction of this document must include the entire document in order for the report to be valid.

Condition of Sample(s) Upon Receipt: **Acceptable**

General Notes

- **ND** indicates no asbestos was detected; the method detection limit is 1%.
- **Trace** or "<1" indicates asbestos was identified in the sample, but the concentration is less than the method detection limit of 1%.
- All regulated asbestos minerals (i.e. chrysotile, amosite, crocidolite, anthophyllite, tremolite, and actinolite) were sought in every layer of each sample, but only those asbestos minerals detected are listed. Amosite is the common name for the asbestiform variety of the minerals cummingtonite and grunerite. Crocidolite is the common name used for the asbestiform variety of the mineral riebeckite.
- Tile, vinyl, foam, plastic, and fine powder samples may contain asbestos fibers of such small diameter (< 0.25 microns in diameter) that these fibers cannot be detected by PLM. For such samples, more sensitive analytical methods (e.g. TEM, SEM, and XRD) are recommended if greater certainty about asbestos content is required. Semi-quantitative bulk TEM floor tile analysis is accepted under the NESHAP regulations.
- These results are submitted pursuant to Aerobiology Laboratory Associates, Inc.'s current terms and conditions of sale, including the company's standard warranty and limitation of liability provisions. No responsibility or liability is assumed for the manner in which the results are used or interpreted.
- Aerobiology Laboratory shall be responsible for all the information provided in the report, except when information is provided by the customer. Aerobiology Laboratory is not responsible for the sampling activity.
- Unless notified in writing to return the samples covered by this report, Aerobiology Laboratory Associates, Inc. will store the samples for a minimum period of thirty (30) days before discarding. A shipping and handling charge will be assessed for the return of any samples.
- Samples identified as inhomogeneous (containing more than one layer) shall be divided into individual layers and each layer tested separately. The results for each individual layer shall be listed separately on the report.

Notes Required by NVLAP

- This report must not be used by the client to claim product certification, approval, or endorsement by NVLAP, NIST, or any agency of the Federal Government.
- This test report relates only to the items tested or calibrated.
- This report is not valid unless it bears the name of a NVLAP-approved signatory.

Total Layers Analyzed: 90

General Notes

- **ND** indicates no asbestos was detected; the method detection limit is 1%.
- **Trace** or "<1" indicates asbestos was identified in the sample, but the concentration is less than the method detection limit of 1%.
- All regulated asbestos minerals (i.e. chrysotile, amosite, crocidolite, anthophyllite, tremolite, and actinolite) were sought in every layer of each sample, but only those asbestos minerals detected are listed. Amosite is the common name for the asbestiform variety of the minerals cummingtonite and grunerite. Crocidolite is the common name used for the asbestiform variety of the mineral riebeckite.
- Tile, vinyl, foam, plastic, and fine powder samples may contain asbestos fibers of such small diameter (< 0.25 microns in diameter) that these fibers cannot be detected by PLM. For such samples, more sensitive analytical methods (e.g. TEM, SEM, and XRD) are recommended if greater certainty about asbestos content is required. Semi-quantitative bulk TEM floor tile analysis is accepted under the NESHAP regulations.
- These results are submitted pursuant to Aerobiology Laboratory Associates, Inc.'s current terms and conditions of sale, including the company's standard warranty and limitation of liability provisions. No responsibility or liability is assumed for the manner in which the results are used or interpreted.
- Aerobiology Laboratory shall be responsible for all the information provided in the report, except when information is provided by the customer. Aerobiology Laboratory is not responsible for the sampling activity.
- Unless notified in writing to return the samples covered by this report, Aerobiology Laboratory Associates, Inc. will store the samples for a minimum period of thirty (30) days before discarding. A shipping and handling charge will be assessed for the return of any samples.
- Samples identified as inhomogeneous (containing more than one layer) shall be divided into individual layers and each layer tested separately. The results for each individual layer shall be listed separately on the report.

Notes Required by NVLAP

- This report must not be used by the client to claim product certification, approval, or endorsement by NVLAP, NIST, or any agency of the Federal Government.
- This test report relates only to the items tested or calibrated.
- This report is not valid unless it bears the name of a NVLAP-approved signatory.

General Notes

- **ND** indicates no asbestos was detected; the method detection limit is 1%.
- **Trace** or "<1" indicates asbestos was identified in the sample, but the concentration is less than the method detection limit of 1%.
- All regulated asbestos minerals (i.e. chrysotile, amosite, crocidolite, anthophyllite, tremolite, and actinolite) were sought in every layer of each sample, but only those asbestos minerals detected are listed. Amosite is the common name for the asbestiform variety of the minerals cummingtonite and grunerite. Crocidolite is the common name used for the asbestiform variety of the mineral riebeckite.
- Tile, vinyl, foam, plastic, and fine powder samples may contain asbestos fibers of such small diameter (< 0.25 microns in diameter) that these fibers cannot be detected by PLM. For such samples, more sensitive analytical methods (e.g. TEM, SEM, and XRD) are recommended if greater certainty about asbestos content is required. Semi-quantitative bulk TEM floor tile analysis is accepted under the NESHAP regulations.
- These results are submitted pursuant to Aerobiology Laboratory Associates, Inc.'s current terms and conditions of sale, including the company's standard warranty and limitation of liability provisions. No responsibility or liability is assumed for the manner in which the results are used or interpreted.
- Aerobiology Laboratory shall be responsible for all the information provided in the report, except when information is provided by the customer. Aerobiology Laboratory is not responsible for the sampling activity.
- Unless notified in writing to return the samples covered by this report, Aerobiology Laboratory Associates, Inc. will store the samples for a minimum period of thirty (30) days before discarding. A shipping and handling charge will be assessed for the return of any samples.
- Samples identified as inhomogeneous (containing more than one layer) shall be divided into individual layers and each layer tested separately. The results for each individual layer shall be listed separately on the report.

General Notes

- **ND** indicates no asbestos was detected; the method detection limit is 1 %.
- **Trace** or "< 1" indicates asbestos was identified in the sample, but the concentration is less than 1% and cannot be quantified without point counting.
- Samples identified as inhomogeneous (more than one layer) are separated into individual layers, and each layer is analyzed and reported separately.
- All regulated asbestos minerals (i.e. chrysotile, amosite, crocidolite, anthophyllite, tremolite, and actinolite) were sought in every layer of each sample, but only those asbestos minerals detected are listed. Amosite is the common name for the asbestiform variety of the minerals cummingtonite and grunerite. Crocidolite is the common name used for the asbestiform variety of the mineral riebeckite.
- Tile, vinyl, foam, plastic, and fine powder samples may contain asbestos fibers of such small diameter (< 0.25 microns in diameter) that these fibers cannot be detected by PLM. For such samples, more sensitive analytical methods (e.g. TEM, SEM, and XRD) are recommended if greater certainty about asbestos content is required. Semi-quantitative bulk TEM floor tile analysis is accepted under NESHAP regulations.
- These results are submitted pursuant to Aerobiology Laboratory Associates, Inc.'s current terms and conditions of sale, including the company's standard warranty and limitation of liability provisions. No responsibility or liability is assumed for the manner in which the results are used or interpreted.
- Unless notified in writing to return the samples covered by this report, Aerobiology Laboratory Associates, Inc. will store the samples for a minimum period of thirty (30) days before discarding. A shipping and handling charge will be assessed for the return of any samples.
- Aerobiology does not guarantee the results of tape lifts, microvacs, wipe, and/or debris samples. Accurate analysis cannot be performed due to particle size, media used, and/or amount of material given. Analysis of these materials should be performed by a TEM. ***A result of ND does not indicate that the sample area does not contain asbestos. It means the analyst could not identify asbestos in the specific sample for the reasons listed above.***

Notes Required by NVLAP

- This report must not be used by the client to claim product certification, approval, or endorsement by NVLAP, NIST, or any agency of the Federal Government.
- This test report relates only to the items tested or calibrated.
- This report is not valid unless it bears the name of a NVLAP-approved signatory.
- Any reproduction of this document must include the entire document in order for the report to be valid.

Appendix I:

CDPH 8552 Form

LEAD HAZARD EVALUATION REPORT

Section 1 — Date of Lead Hazard Evaluation

Section 2 — Type of Lead Hazard Evaluation (Check one box only)

Lead Inspection
 Risk assessment
 Clearance Inspection
 Other (specify)

Section 3 — Structure Where Lead Hazard Evaluation Was Conducted

Address [number, street, apartment (if applicable)]		City	County	Zip Code
Construction date (year) of structure	Type of structure	Children living in structure?		
	<input type="checkbox"/> Multi-unit building <input type="checkbox"/> School or daycare <input type="checkbox"/> Single family dwelling <input type="checkbox"/> Other 	<input type="checkbox"/> Yes <input type="checkbox"/> No <input type="checkbox"/> Don't Know		

Section 4 — Owner of Structure (if business/agency, list contact person)

Name		Telephone number	
Address [number, street, apartment (if applicable)]		City	State
		Zip Code	

Section 5 — Results of Lead Hazard Evaluation (check all that apply)

No lead-based paint detected
 Intact lead-based paint detected
 Deteriorated lead-based paint detected
 No lead hazards detected
 Lead-contaminated dust found
 Lead-contaminated soil found
 Other

Section 6 — Individual Conducting Lead Hazard Evaluation

Name		Telephone number	
Address [number, street, apartment (if applicable)]		City	State
		Zip Code	
CDPH certification number	Signature	Date	
			

Name and CDPH certification number of any other individuals conducting sampling or testing (if applicable)

Section 7 — Attachments

- A. A foundation diagram or sketch of the structure indicating the specific locations of each lead hazard or presence of lead-based paint;
- B. Each testing method, device, and sampling procedure used;
- C. All data collected, including quality control data, laboratory results, including laboratory name, address, and phone number.

First copy and attachments retained by inspector
 Second copy and attachments retained by owner

Third copy only (no attachments) mailed or faxed to:

COUNTY OF RIVERSIDE • COMMUNITY HEALTH AGENCY
DEPARTMENT OF ENVIRONMENTAL HEALTH

October 7, 2010

Site #9915833

Mr. Raj Kumar
703 E. Sixth Street
Corona CA 91720

RE: Underground Storage Tank Cleanup at the former Texaco (now Raj Ultramar) located at 301 North Main Street in Lake Elsinore Site #9915833

Dear Mr. Kumar:

This letter confirms the completion of a site investigation and corrective action for the underground storage tanks formerly located at the above described location. Thank you for your cooperation throughout this investigation. Your willingness and promptness in responding to our inquiries concerning the former underground storage tanks are greatly appreciated.

Based on the information in the above-referenced file, and with the provision that the information provided to this agency was accurate and representative of site conditions, this agency finds that the site investigation and corrective action carried out at your underground storage tanks site is in compliance with the requirements of subdivisions (a) and (b) of Section 25296.10 of the Health and Safety Code and with corrective action regulations adopted pursuant to Section 25299.3 of the Health and Safety Code and that no further action related to the petroleum release at the site is required.

This notice is issued pursuant to subdivision (g) of Section 25296.10 of the Health and Safety Code. If you have any questions regarding this matter, please contact Sharon Boltinghouse at (951) 955-8982.

Sincerely,

Steve Van Stockum
Director, Environmental Health

Title: Associate Public Health Professional Geologist

Date: 11-10-10

VI. RWQCB Notification

Date Submitted To RWQCB:

Date Signed By RWQCB: 6/15/10

RWQCB Staff Assigned To Case: *JME*RWQCB Response: *Concurs w/ Closure*Signature: *Kenneth R. Williams*Title: *Chief, UST Section*

VII. Additional Comments, Data, Etc.

Site History/Release Information:

On February 10, 1999, between 4 and 6 UST's were removed from the site. (Records are not clear on exactly how many tanks were at the site) Up to 1520 ppm TPHg and 26.1 ppm MTBE were detected beneath the tanks. 294 tons of soil was removed from the UST cavity.

Assessment:

On June 27-28, 2001, 5 groundwater (gw) monitoring wells were installed and screened from 10 to 35 feet below grade. Concentrations up to 2200 ppm TPHg and 8 ppm MTBE were detected in the soil from 15 to 35'.

On April 7 and 8, 2003, six additional gw monitoring wells were installed and screened from 10 to 30 feet below grade. Soil samples were analyzed for TPHg, VOCs and oxygenates using EPA Methods 8015M and 8260 full scan. All soil samples were non-detect for all constituents tested except one sample which had 0.13 ppm MTBE (MW-7 at 25 feet).

Groundwater Monitoring:

GW sampling was conducted quarterly from March 2003 to October 2008, and again in December 2009. Water levels have fluctuated from 14 to 23 feet below grade with flow directions consistently to the NNE. Up to 3400 ppb TPHg, 1.4 ppb benzene, 2.29 ppb toluene, 127 ppb ethylbenzene, 15 ppb xylenes, 8600 ppb MTBE, 1.8 ppb TAME, and 530 ppb TBA were detected initially. Well MW-5 is the only well that has had any significant TPHg and the levels have been fluctuating after initially decreasing for the first four years. MTBE and TBA decreased drastically in all wells where it was detected. During the December 2009 event, the maximum levels were 3400 ppb TPHg, 6.1 ppb xylenes, 2.1 ppb MTBE; all other constituents of EPA Methods 8015M and 8260 full scan were not detected.

Remediation:

A 72-hour dual-phase extraction (DPE) test was completed between April 7 and 10, 2003, using wells MW-1, MW-4 and MW-5 for 24-hours each. A total of 1293.4 gallons of gw was removed during the test. Vapor TPHg went from 290 to 660 ppmv in MW-1, from 230 to 11 ppmv in MW-4 and 9.1 to 14 ppmv in MW-5. No benzene was detected in any of the vapor samples. MTBE went from 7.7 to 8 ppmv in MW-1 and from <2.8 to 4.3 ppmv in MW-4. MTBE was not detected in MW-5. Groundwater TPHg remained consistent at 1600 ppb in MW-1 and decreased in MW-5 from 310 to 270 ppb. MTBE remained consistent at approximately 700 ppb in MW-1 and increased in well MW-4 from 2900 to 3500 ppb.

CASE CLOSURE SUMMARY
LEAKING UNDERGROUND FUEL STORAGE TANK PROGRAM

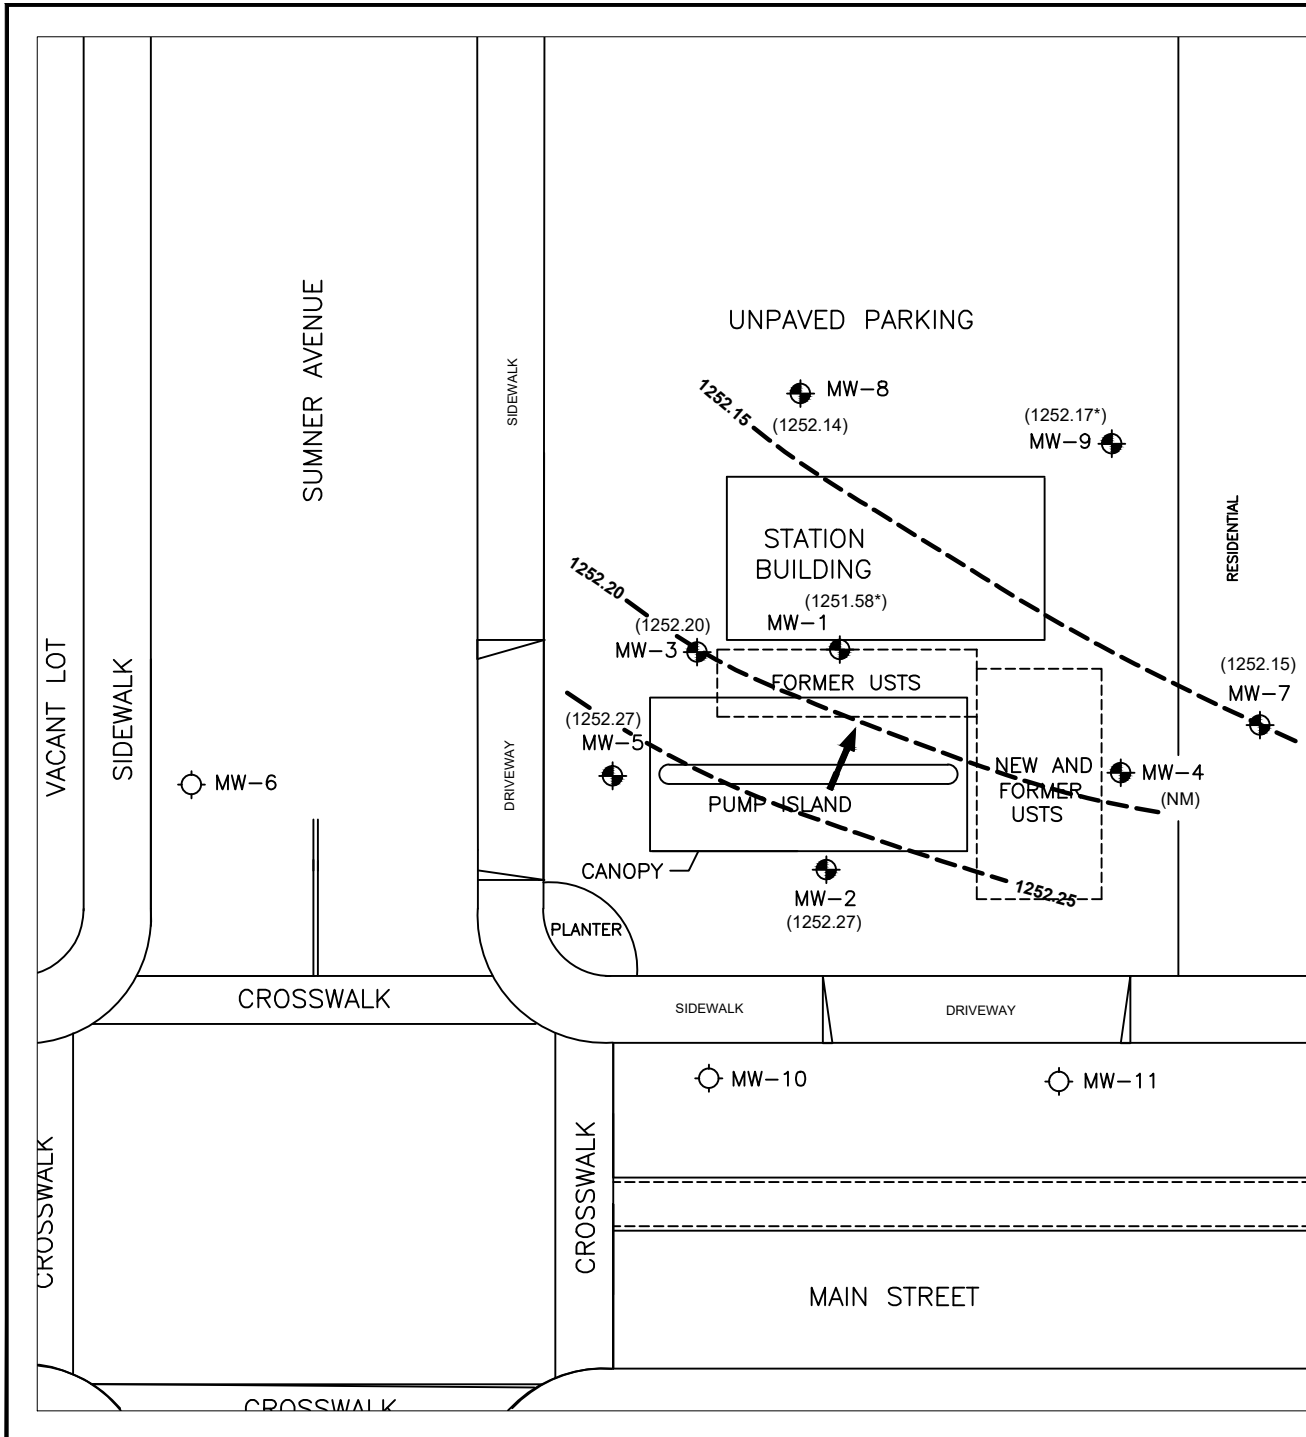

SITE NAME: Texaco (Raj Ultramar)

SITE NO: 9915833

An additional 10-day DPE event was conducted September 8 -17, 2004 using MW-4 and MW-7 for the first 5 days and MW-1 and MW-5 for the second 5 days. TPHg vapor concentrations were stable and below 100 ppmv during the test. BTEX or MTBE were not detected in any of the vapor samples. TPHg in the water dropped from 1500 ppb to 853 ppb in MW-5. MTBE in the groundwater dropped from 1430 to 513 ppb in MW-7. All other wells were ND at that point. 6436 gallons of groundwater and 8.55 lbs of TPHg were removed during the 10-day event.

Other information: UST system currently installed and operating at the site.

NOTE: This closure summary does not include all of the data for this cleanup. It was prepared by the Riverside County DEH for the purpose of providing a brief summary for case closure evaluation. The *Request for Site Closure* (Stratus Environmental, Inc. April 30, 2010) and all other environmental reports pertaining to this cleanup site as well as the RCDEH Local Oversight Program case file should be reviewed in their entirety to obtain further details regarding this cleanup.

Dear Mr. Ferguson:

On February 28, 2011, we sent a notification of proposed site closure and a copy of the draft *Case Closure Summary* to you and to other interested parties. No comments were received during the 30-day review period.

Provided that the information submitted to this agency was accurate and representative of site conditions, no further action is required for this site and a copy of the final *Case Closure Summary* is attached.

This notice is issued pursuant to a regulation contained in Title 23, California Code of Regulations, Division 3, Chapter 16, Section 2721(e).

If you should have any questions, please contact Kenneth R. Williams at (951) 782-4496 or Tom Mbeke-Ekanem at (951) 320-2007 or via e-mail at tmbeke-ekanem@waterboards.ca.gov.

TBA	ND	NA	NA	NA

COMMENTS REGARDING INVESTIGATION AND REMEDIATION

On September 15, 1993, eight soil borings were advanced at the site to a depth of 33 feet below ground surface (bgs). Groundwater was encountered between 30 and 32 feet bgs. The analytical results obtained from the soil samples indicated detectable petroleum hydrocarbon concentrations in the vicinity of the UST pits. The results of the investigation showed a TPHg concentration of 6,600 ppm at 30 feet. Benzene were detected at levels ranging from 0.03 ppm at 30 feet to 0.036 ppm at 20 feet. Toluene was detected at levels ranging from 0.097 ppm at 20 feet to 230 ppm at 30 feet. Ethylbenzene were detected at levels ranging from 0.022 ppm at 20 feet to 69 ppm at 30 feet, while total xylenes were detected at levels ranging from 0.17 ppm to 420 ppm at 20 feet. Samples were not analyzed for MtBE at this time.

On February 5, 2004, two 8,000-gallon gasoline USTs, one 7,000-gallon gasoline UST, one 7,000-gallon diesel UST, four fuel dispensers and associated piping were removed from the site. In June 2004, an additional site investigation was conducted and five borings were advanced to 35 feet bgs. Analytical results obtained from the samples showed TPHg concentrations as high as 2,940 ppm at 15 feet, while a TPHd concentration of 2,480 ppm was detected at 2 feet. The maximum concentrations identified for BTEX were 0.025 ppm, 17.2 ppm, 12.6 ppm, and 148 ppm. MtBE was detected at a maximum concentration of 0.482 ppm.

The 1993 site assessment indicated the existence of a 500-gallon waste oil UST located south of the service station building. However, this UST was not listed in the 2004 UST removal report. There is no sampling data available for the waste oil UST. However, a report attributed to Mr. Ferguson stated that the waste oil tank was actually a 250-gallon above-ground storage tank which was removed in 1994. Because the responsibly party was in bankruptcy, remedial work at this site did not commence until 2008.

Additional subsurface investigation was conducted in September 2008, consisting of the advancement of ten soil borings, SB-8 through SB-17, to a depth of 30 feet bgs using direct push technology equipment. Analysis of the soil samples showed TPHg in SB-12 at 5 feet, and in SB-13 between 15 and 35 feet bgs, with the highest concentration of 1,230 ppm at 30 feet bgs. TPHd was reported in SB-8, SB-9, SB-12 and SB-13 at concentrations ranging between 13.2 and 9,010 ppm.

All other hydrocarbon components were below method detection limits. Neither benzene nor MtBE concentrations were reported in any soil samples collected at this time. Analytical results of groundwater showed TPHg concentrations in SB-13, SB-15, and SB-16 ranging between 8.52 and 304 ppm. Benzene was detected in SB-14 at a concentration of 547 ppb, and MtBE was detected at 7.42 ppb.

An investigation of the subsurface conditions conducted during the first and second week of June 2009 consisted of four soil borings drilled to a depth of 33 feet bgs using direct push technology equipment. Analysis of the soil samples showed TPHg with the highest concentration of 193 ppm at 33 feet bgs in boring MW-4, which is at the monitoring well furthestmost down-gradient of the plume. All four borings were converted to groundwater monitoring wells. Analyses of samples from monitoring wells MW-2 and MW-4 showed BTEX concentrations in groundwater of be 1040 ppb and 1.74 ppb, respectively. The other two wells, MW-1 and MW-3, were non-detects.

Data gathered at this site indicates that of all the nine soil borings advanced in 2008 had non-detects except SB-13 at a depth of 25 feet and 30 feet bgs, with considerable concentrations of hydrocarbons that have not been detected in any other location. Moreover, sampling results from of the three soil borings conducted in June 2009 were all non-detects.

On December 3, 2009, a fifth groundwater monitoring well (MW-5) was installed on the south side of Flint Street, which is on the west of Main Street. None of the newly installed wells, including monitoring well MW-5, were found to have free product. Results of the analyses found concentrations of benzene, toluene, ethylbenzene, xylene (BTEX) and MTBE to be non-detect in several of the samples collected from soil boring (MW-5), which was tested every five feet to a depth of 35 feet bgs. TPH as gasoline was not detected above method detection limits while TPH as diesel concentrations above method detection limits were only reported at 15.3 mg/kg at 5 feet bgs. Oxygenates were not reported above method detection limits in any of the soil samples analyzed.

Analysis of samples from monitoring wells on September 15, 2010 indicated TPH-g, benzene, toluene, ethylbenzene, and total xylenes with concentrations of 1,360 ppb, ND, 2.0 ppb, 57.0 ppb, and 6.67 ppb, respectively. The highest MtBE concentration reported was 23.10 ppb in monitoring well MW-4. TBA was never detected and no free product has ever been detected at the site. Essentially, MtBE and all other oxygenates were found below allowable limits.

It is our position that the extent of gasoline impacted soil and groundwater has been fully addressed. In view of the low to non-detection nature of the contaminants on this site, further investigation on or off-site of this property is deemed to be unnecessary.

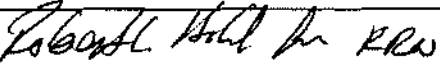

Based on the information received regarding the recent groundwater sampling events, it does not appear that the remaining petroleum hydrocarbon compound concentrations at this site pose a continuing threat to shallow groundwater. Therefore, site closure is recommended.

FORMER LAKE ELSINORE MANUFACTURED GAS PLANT SITE, LAKE ELSINORE, CALIFORNIA - FINAL REMOVAL ACTION AND SITE CERTIFICATION

Dear Ms. Bohrerud:

On June 30, 2003 the Department of Toxic Substances Control (DTSC) approved your revised Soil Remediation Closure Report, prepared by ENV America dated June 6, 2003 for the former Lake Elsinore manufactured gas plant property, Lake Elsinore, California (Site).

The goal, upon completion of the removal action, was to assure that the property can be used for unrestricted uses. To achieve this goal, confirmation samples were collected following excavation activities and soil samples were analyzed for polynuclear aromatic hydrocarbons (PAHs). Statistical analyses were conducted to ensure that post-removal concentrations met the cleanup goals and background conditions.

Based on the previous analysis conducted at the Site, carcinogenic PAHs were the main chemicals of concern. In accordance with the Removal Action Workplan (RAW) dated August 2002, the target clean-up concentration for PAHs was set at 0.9 milligrams per kilogram (mg/Kg) of B(a)P equivalent concentration. The cleanup standard for soil of 0.9 mg/kg of B(a)P meets the risk criteria for residential occupancy. Approximately 3,394 tons of contaminated soil exceeding 0.9 mg/Kg of B(a)P was excavated and transported to an offsite treatment facility (TPS Technologies, Inc., Adelanto, California) for treatment and recycling. Chemical analysis of groundwater samples showed trace amounts of volatile organic compounds (VOCs), which were well below the Maximum Contaminant Levels (MCLs) and do not pose a risk to human health or the environment.

Based on DTSC's approval of the Revised Soil Remediation Closure Report dated June 2003, and DTSC's oversight of removal activities conducted on the Site, DTSC hereby certifies that the removal goals specified in the Removal Action Workplan (RAW) volumes I and II, dated May 17, 2002, including the revision incorporating DTSC's comments, and the groundwater investigation report dated June 2003,

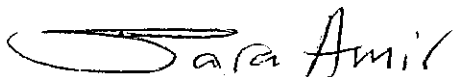

The energy challenge facing California is real. Every Californian needs to take immediate action to reduce energy consumption. For a list of simple ways you can reduce demand and cut your energy costs, see our Web-site at www.dtsc.ca.gov.

Ms. Anita Bohnerud
July 2, 2003
Page 2

have been successfully implemented and that no further action is required. As with any site, if future conditions become known at the site that present a threat to human health or the environment, DTSC reserves the right to take appropriate response action to mitigate such conditions.

If you have any questions or comments, please contact Mr. Pradip Desai at (714) 484-5471, or me at (714) 484-5459

Sincerely,

Bob Thomas M. Cota, Chief

Los Angeles, California 90013-1011
Telephone: (213) 244-5828**

Relationship to site: **Past owner**

Property owners. (Current Owners) **Various**

3. Brief Description and History of the Site:

Site Location:

The Site is located at the 400 block of Pottery Street, City of Lake Elsinore, Riverside County, California 92530, Assessor's Parcel: Book 374, Page 062 Parcels 004, 008, 011, 012, 013 and 014. The Site occupies approximately 2.8 acres and is zoned tourist/commercial according to the City of Lake Elsinore Planning Department.

The Site is bounded by Flint Street to the North, Spring Street to the east, Pottery Street to the south, and Riley Street to the west. An easement for the Lake Elsinore Outlet Channel (Outlet Channel) occupies the western portion of the Site.

The Outlet Channel was enlarged and improved by the U.S. Army Corps of Engineers and the Riverside County Flood Control District. The improvement project started in

1993 and was completed in 1994. The Outlet Channel provides 100-year flood protection to the downtown portion of Lake Elsinore, by providing an outlet should the water level rise in the lake. The Outlet Channel consists of improved, unlined trapezoidal open channel, approximately 2.5 miles in length, running from Lake Elsinore to Riverside Drive. The base width of the Outlet Channel ranges in size from 20 feet to 80 feet. In the Site area, the Outlet Channel is approximately 12 feet deep, with a 35-foot base width and 1 to 3 (vertical to horizontal) sidewalls. Parcels 12 and 14 were used for the enlargement of the Outlet Channel. The base of the Outlet Channel slopes toward the lake in the area of the Site.

Access to the Site is limited by a chain-link fence. Parcels 11 and 13 are also divided by a chain-link fence. Parcels 12 and 14 were used for widening of the Outlet Channel.

Site History:

The Elsinore Gas Company began operating the MGP at the Site in the mid-1920s. The Elsinore Gas Company operated the MGP until 1929. The Gas Company discontinued operations in 1929, presumably within one week of acquisition of the Site. Site layout maps [Southern California Gas Company 1929 and 1951], Sanborn maps, historical records, aerial photographs, and title search information indicated that certain MGP-related equipment (gas holder, aboveground tanks, gas generator, etc.) were present since at least 1925 and remained at the Site through 1953.

The Elsinore Gas Company was the owner/operator during the period between the mid-1920s and 1929. The Gas Company was the owner/operator during the period between 1929 and 1953, when the Site was used for storage and distribution of natural gas. White House Sanitation is the current owner/operator of the sanitary disposal/storage equipment company.

Parcels 12 and 14 were deeded to the City of Lake Elsinore in 1983. Parcels 12 and 14 were used for widening of the Outlet Channel and are part of the Outlet Channel. Currently, the Outlet Channel is owned and maintained by the Riverside County Flood Control District. Additionally, in 1993, Parcel 13, along the east side of the Outlet Channel, was purchased by the City of Lake Elsinore to accommodate the widening of the Outlet Channel and served as a construction staging area.

The Atcheson, Topeka and Santa Fe Railroad owned a small portion of the northeastern part of the property (Parcels 3, 4 and 8). The property was acquired from the Temescal Water Company in 1896 and was never associated with the gas manufacturing facility.

Project Description:

The removal project was implemented under the direction of DTSC in accordance with the DTSC Voluntary Cleanup Agreement Docket No. HAS-A 00/01-230, and under the authority of Chapter 6.5 of the California Health and Safety Code. The project involved remediation of Polynuclear aromatic hydrocarbons (PAH) contaminated soils in accordance with the methods and procedures presented in the final Removal Action Workplan (RAW).

The project involved 3,394 tons of contaminated soil excavation and transportation of impacted soils to a thermal treatment facility in Adelanto, California.

Based on the review of available data, after completion of remediation, the site has met the cleanup goals identified in the RAW. Residual chemicals concentrations at the Site are within the cleanup criteria, and the backfill materials brought onto the Site have not increased the health risk from naturally occurring contaminants.

Soil remediation in targeted areas was conducted in accordance with the following general sequence:

1. Pavement, where present, was cut and removed.
2. Impacted soils remediated using excavation tools. Soil removal methods included either/or a combination of the following:
 - a. Manual labor,
 - b. Specialized excavation equipment (i.e., excavators, backhoes),
3. Excavated soils loaded into trucks or bins and transported to the treatment facility.
4. Minimal temporary stockpiling of soil.
5. Clean soils backfilled into excavations and compacted using small compaction equipment.
6. Following backfill, compaction and grading, paving was replaced, where needed.

The goal, upon completion of remediation, was to assure that the property can be used for unrestricted uses. To achieve this goal, confirmation samples were collected following excavation activities and prior to backfilling and restoration activities with the objective of providing assurance that the soil removal activities have adequately remediated the Site, and that the remedial action goal has been achieved. Confirmation soil samples were analyzed for PAH concentrations. Statistical analyses were conducted to compare post-remediation concentrations against background concentrations and to *de minimis* incremental risk concentrations, to determine if the Site has been restored to background conditions.

Based on review of available data, after completion of remediation, the Site has met the cleanup goals identified in the RAW. Residual chemical concentrations at the Site are within the cleanup criteria, and the health risk has not increased from backfill materials brought onto the Site.

Impacted soil excavated from the Site was transported to TPS Technologies Inc. (TPS) located at 12328 Hibiscus Avenue, Adelanto, California. TPS is a treatment/recycling facility that treats soils by thermal desorption, in which heat is used to desorb chemicals from the soil. Soil is fed into a materials dryer where heated air causes chemicals to volatilize. A temperature of about 700°F is required for high molecular weight PAHs removal. The exhaust air is then directed to a scrubber and carbon adsorption (or afterburner) unit. After chemicals in the air are captured by the carbon or destroyed in the afterburner, and the cleaned air is vented into the atmosphere. Each day's production volume of soil is held separately while the residual concentrations are determined.

4. Type of Site: (Check appropriate response)
Included in **Annual Workplan**.

Yes No

RCRA-Permitted Facility Bond - funded

RCRA Facility Closure RP - funded

*NPL

Federal Facility

Other (i.e., walk-in): _____ Explain Briefly:

5. Size of Site: (Based on Expenditure Plan definition of size)

Small Medium Large Extra Large

6. Dates of Remedial Action:

a. Initiated 11/01/02 b. Completed 11/22/02

*Per SARA, any NPL site that is not permanently cleaned must be scheduled for a follow-up visit after 5 years to verify that cleanup measures are still satisfactory.

7. Response Action Taken on Site: (check appropriate action)

- Initial Removal or Remedial Action (site inspection/sampling)
- Final Remedial Action
- RCRA enforcement/closure action
- No action, further investigation verified that no cleanup action at site was needed.

A. Type of Remedial Action (e.g. Excavation and disposal off-site treatment):
Soil excavation and off-site treatment/disposal.

B. Estimated quantity of waste associated with the site (i.e., tons/gallons/cubic yards) which was:

- 1. treated (groundwater) Amount: _____ gallons
- 2. untreated (capped sites) Amount: N/A
- 3. removed (VOCs) Amount: _____ lbs.
- removed (soil) Amount: **3,394 tons**

8. Cleanup Levels/Standards

a. What were the cleanup standards established by DTSC pursuant to the final remedial action plan (RAP) or workplan (if cleanup occurred as the result of a removal action (RA) or interim remedial measures (IRM) prior to development of a RAP)?

The polyaromatic hydrocarbon (PAHs) B(a)P cleanup standard for soil of 0.9 mg/kg of B(a)P meets health risk criteria set for residential occupancy.

- b. Were the specified cleanup standards met? Yes No
- c. If "no", why not: **N/A**

9. DTSC Involvement in the Remedial Action:

A. Did the Department order the Remedial Action?

Yes No

B. Did the Department review and approve (check appropriate action and indicate date of review/approval if done):

Sampling Analysis Procedures Date **Oct.1, 2002**

Health & Safety Procedures Date Oct.1, 2002

Removal/Disposal Procedures Date Oct.1, 2002

Remedial Action Plan (Removal Action Workplan) Date Oct.1, 2002

C. If site was abated by a responsible party, did the Department receive a signed statement from a licensed professional on all Remedial Action?

Yes No ___ Date "Site Closure Report" dated June, 2003 from ENV America Inc.

D. Did a registered engineer or geologist verify that acceptable engineering practices were implemented?

Yes No ___ Name: Mr. E. Essi Esmaili, Ph.D.,R.G., C.HG. ENV America Inc.

Date of verification: June 10, 2003

E. Did the Department confirm completion of all Remedial Action?

Yes No ___ Date of verification: June 30, 2003

(i.e. manifest, sampling, demonstrated installation and operation of treatment)

F. Did the Department (directly or through a contractor) actually perform the Remedial Action?

Yes ___ No Name of contractor ENV America Inc.

G. Was there a community relations plan in place?

Yes No ___

H. Was a remedial action plan developed for this site?

Yes ___ No **The work was conducted under a Removal Action Workplan.**

I. Did DTSC hold a public meeting regarding the draft RAP?

Yes ___ No

A Fact Sheet dated March 2001, was issued to the community, soliciting public comments.

J. Were public comments addressed?

Yes No ___

K. Are all of the facts cited above adequately documented in the DTSC files?
Yes No

If no, identify areas where documentation is lacking.

10. EPA Involvement in the Remedial Action:

A. Was the EPA involved in the site cleanup? Yes No

B. If yes, did EPA concur with all remedial actions?
Yes No **N/A**

C. EPA comments **N/A**

EPA staff involved in cleanup: (Name, Title, Address, Phone Number) **N/A**

11. Other Regulatory Agency Involvement in the Cleanup Action:

Agency:

Activity:

RWQCB Copied on key documents. No active involvement.

ARB

CHP

Caltrans

Other City of Lake Elsinore Planning Department for Construction Work Permit, County Flood Control for access to channel side.

Name of contact persons and agency:

12. Post-Closure Activities:

A. Will there be post-closure activities at this site? (e.g. Operation and Maintenance) Yes No

If yes, describe:

B. Have post-closure plans been prepared and approved by the Department? Yes No **N/A.**

C. What is the estimated duration of post-closure (including operations and maintenance) activities?
_____ years. **N/A.**

D. Are deed restrictions proposed or in place?
Yes__ No **X** Site was remediated to residential standards as per DTSC approved RAW.

If "yes" have deed restrictions been recorded with the County recorder?
Yes__ No__ Date **N/A.**

If "no", who is responsible for assuring that the deed restrictions are recorded? **N/A.**

Department contact: **Pradip Desai (714) 484-5471**

E. Has cost recovery been initiated? Yes__ No **X**

If yes, amount received \$_____; _____% of DTSC costs, to date.

F. Were local planning agencies notified of the cleanup action? Yes **X** No__
If yes, the name and address of agency: **City of Lake Elsinore Planning Department, 130 South Main Street, Elsinore CA 92530.**

13. Expenditure of Funds and Source:

(Information to be supplied by Toxic Accounting Unit.)

Funding Source and amount expended:

___ HWCA \$ _____ ___ HSA \$ _____

___ HSCF \$ _____ ___ RCRA \$ _____

X RP \$ _____ ___ Others _____

___ Federal Cooperative Agreement \$ _____

14. Certification Statement: Based upon the information which is currently and actually known to the Department,

X The Department has determined that all appropriate response actions have been completed, that all acceptable engineering practices were implemented and that no further removal/remedial action is necessary.

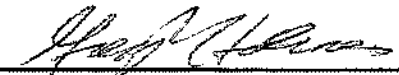

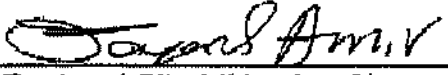

The Department has determined, based upon a remedial investigation or site characterization that the site poses no significant threat to public health, welfare or the environment and therefore implementation of removal/remedial measures is not necessary.

 X The Department has determined that all appropriate removal/remedial actions have been completed and that all acceptable engineering practices were implemented and the site requires no operation and maintenance (O&M) and monitoring efforts. The site will be deleted from the "active" site list.

15. Additional Comments: None.

16. Certification of Remedial Action:

I hereby certify that the foregoing information is true and correct to the best of my knowledge.

520 NORTH RILEY, LAKE ELSINORE**

Dear Ms. Kuntz:

This letter confirms the completion of site investigation and remedial action for the underground storage tanks (USTs) formerly located at the above-described location. A copy of the Case Closure Summary is enclosed. Thank you for your cooperation throughout this investigation. Your willingness and promptness in responding to our inquiries concerning the former USTs are greatly appreciated.

Based on the information in the above-referenced file and with the provision that the information provided to this agency was accurate and representative of site conditions, this agency finds that the site investigation and corrective action carried out at the above-referenced UST site is in compliance with the requirements of subdivisions (a) and (b) of Section 25296.10 of the Health and Safety Code and with corrective action regulations adopted pursuant to Section 25299.3 of the Health and Safety Code and that no further action related to the petroleum releases(s) at the site is required.

This notice is issued pursuant to subdivision (g) of Section 25296.10 of the Health and Safety Code.

Please be aware that claims for reimbursement of corrective action costs submitted to the Underground Storage Tank Cleanup Fund (Fund) more than 365 days after the date of this letter or issuance or activation of the Fund's Letter of Commitment, whichever occurs later, will not be reimbursed unless one of the following exceptions applies:

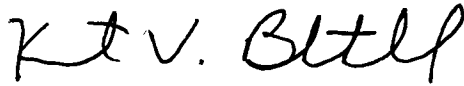

- Claims are submitted pursuant to Section 25299.57, subdivision (k) (reopened UST case); or
- Submission within the timeframe was beyond the claimant's reasonable control, ongoing work is required for closure that will result in the submission of claims beyond that time period, or that under the circumstances of the case, it would be unreasonable or inequitable to impose the 365-day time period.

WILLIAM R. JELI, CHAIR | KURT V. BERGHOLD, EXECUTIVE OFFICER

3737 Main St., Suite 300, Riverside, CA 92503 | www.waterboards.ca.gov/sarwqcb

If you have any questions or concerns, please contact Kenneth R. Williams or Nancy Olson-Martin of my staff at (951) 782-4496 or 4497, respectively. You may also contact them via e-mail at ken.williams@waterboards.ca.gov and nancy.olson-martin@waterboards.ca.gov, respectively.

Sincerely,

Kurt V. Berchtold
Executive Officer

Enclosure: Copy of the *Case Closure Summary*

¹In October 1996, boring B11 was drilled in proximity to boring/well B3/MW2; concentrations were significantly less than the results for earlier boring B3/MW2.

²In 1997, boring B12 was drilled three (3) to four (4) feet of boring B3/MW2 to further define the vertical extent of contamination in the former west building tank cavity area. The maximum concentrations were detected in the samples collected from the 10-foot depth. A significant decrease of contaminant concentrations (TPH-g, TPH-d, and BTEX) was observed in the soil adjacent to boring/well B3/MW2 and boring B11.

³In 1996, free product sheen was noted in wells MW1 and MW2 during initial drilling and sampling activities.

⁴In December 1999, free product sheen was noted in well MW1. No groundwater sampling events were conducted from 2001 and 2007.

⁵The maximum contaminant concentrations detected for the shallow-screened wells during the latest event.

⁶The maximum contaminant concentrations detected for deeper-screened well MW9 during the latest event.

⁷The maximum contaminant concentrations detected in shallow-screened wells.

⁸The maximum contaminant concentrations detected in deeper-screened well MW9.

⁹In March 10, 2010, the TPH-d results for well MW-9 were estimated value (shown as E); value exceeded calibration of laboratory equipment.

¹⁰NA=compound was not analyzed. ND=Compound was not detected over the laboratory detection limits or non-detectable (ND).

⁵Maximum concentrations of other VOCs that are not listed above:

- Methyl-2-Pentanone was detected up to 7.8 ppb in 3/10 (MW9-20').
- 1,1-Dichloroethane was detected up to 2 ppb in 3/10 (MW9-20').
- 1,2-Dichloropropane was detected up to 1.2 ppb in 3/10 (MW9-20').
- Tert-butylbenzene was detected up to 120 ppb in 3/10 (MW9-30') in the groundwater. Also, tert-butylbenzene was detected up to 0.24 ppm (MW10-20') in the soil samples.

IV. CLOSURE

Does completed corrective action protect beneficial uses per the regional board basin plan? YES NO **Note: Presently, the site is a vacant lot.**

Does the corrective action protect public health for current land use? YES NO

SITE MANAGEMENT REQUIREMENTS

Should corrective action be reviewed if land use changes? **Due to the residual soil contamination beneath the site, a soil gas survey and/or Human Health Risk Assessment will be required for any residential or commercial use.**

YES NO

V. ADDITIONAL COMMENTS, DATA, ETC.

SITE HISTORY/LAND USE

The site contained two (2) former underground storage tanks (USTs) that were operated by the County of Riverside (County) until 1975 as road maintenance yard known as the *Old Elsinore Road Yard*. In 1978, the County sold the property to Mr. & Mrs. Redman. In November 1993, the County of Riverside Department of Environmental Health (CRDEH) notified the Redman's that the two (2) on-site USTs would need to be operated, temporarily closed, or removed.

On December 21, 1993, the two USTs (one 1,000-gallon and one 550-gallon tanks) were removed from the site pursuant to CRDEH's requirements. The 1,000-gallon and 550-gallon USTs were noted as the *West* and *East USTs*, respectively. The CRDEH *Inspection Report* noted that small and large holes were observed in both USTs. In addition, the report noted that petroleum-like odors were noted during the tank excavations.

V. ADDITIONAL COMMENTS, DATA, ETC.

Petroleum-related contamination was detected in all four (4) of the soil confirmation samples. The samples were collected from the following locations:

1. Samples E1 (samples collected at the 2 and 6-foot depths) were collected from the former 500-gallon East Tank pit.
2. Samples W1 (samples collected at the 2 and 6-foot depths) were collected from the former 1,000-gallon West Tank pit.

Total petroleum hydrocarbons-gasoline (TPH-g) concentrations were detected in all four samples and ranged from 120 ppm (E1-6') to 3,400 ppm (W1-6'). Total petroleum hydrocarbons-diesel (TPH-d) and total recoverable petroleum hydrocarbon (TRPH) concentrations were also detected in all four (4) samples and ranged from 410 ppm (W1-6') to 1,800 ppm (E1-2') and 2,400 ppm (E1-6') to 29,000 ppm (E1-2'), respectively.

In addition, soil samples collected from E1-2' and W1-6' were also analyzed for benzene, toluene, ethylbenzene, and total xylenes (BTEX). Benzene concentrations were detected at 0.98 ppm and <83 ppm, respectively. Maximum toluene, ethylbenzene, and total xylenes concentrations were detected in sample W1-6' at 710 ppm, 160 ppm, and 1,100 ppm, respectively.

It appeared that the USTs contained a variety of gasoline, diesel and possible waste oil products over the years at this site. As a result of the contamination detected during UST removal activities, the Redmans filed a lawsuit against the County. In 1978, the County purchased the property back from the Redmans. In order to avoid any conflict of interest, CRDEH referred the case to Regional Board staff on March 3, 1995.

The site is located at the northeast corner of the intersection of North Riley Street and Flint Street in Lake Elsinore, California. Presently, the site is a vacant lot.

SITE ASSESSMENT

1996

In January 1996, five (5) soil borings were drilled to 20 feet bgs (B2 and B4), 25 feet bgs (B5), and 31 feet bgs (B1 and B3). Three soil borings B1, B3, and B5 were converted to wells MW1, MW2, and MW3, respectively. Groundwater was encountered at approximately 10 feet bgs. The wells were screened from 5 to 30 feet (MW1 and MW2) and 5 to 25 feet (MW3) bgs. During development and purging activities conducted on wells MW1 and MW2, free product sheen was noted in each well. A groundwater gradient flow direction to the southwest (toward the Walker Drainage and Lake Elsinore) was noted.

The borings/wells were drilled in the following areas of the site:

1. B1/MW1 was drilled southeast of the former 550-gallon UST (East Tank).
2. B2 was drilled southwest of the former 550-gallon UST (East Tank).
3. B3/MW2 was drilled west of the former 1,000-gallon UST (West Tank).
4. B4 was drilled southwest of boring B3/MW2 and the former 1,000-gallon UST (West Tank).
5. B5/MW3 was drilled southwest of the former USTs.

Elevated levels of contaminant concentrations were detected in the soil samples collected from B1/MW1 and B3/MW2 down to approximately 20 feet bgs. Maximum TPH-d, TPH-g, and BTEX concentrations were detected at 15,000 ppm (B1/MW1-10'), 18,000 ppm (B3/MW2-10'), 81 ppm (B3/MW2-15'), 740 ppm (B3/MW2-10'), 360 ppm (B3/MW2-10'), and 1,800 ppm (B3/MW2-10'), respectively.

Also, MTBE was detected in sample B3/MW3-10' at 3.2 ppm. Minor TPH-d, TPH-g, and/or BTEX concentrations were detected in the soil samples collected from boring B2. All of the soil results for boring B5/MW3 were detected below the method detection limit or were non-detectable (ND).

V. ADDITIONAL COMMENTS, DATA, ETC. – continued:

Elevated levels of groundwater contamination were detected in samples collected from wells MW1 and MW2. Maximum TPH-g, TPH-d, BTXE, and MTBE concentrations were detected at 68,000 ppb (MW2), 14,000 ppb (MW1), 5,600 ppb (MW2), 19,000 ppb (MW2), 2,300 ppb (MW2), 15,000 ppb (MW2) and 210 ppb (MW1), respectively. Only trace toluene (2.1 ppb) and ethylbenzene (0.75 ppb) concentrations were detected in the samples collected from well MW3.

In October 1996, six (6) additional borings (B6 through B11) were completed. The borings were drilled to approximately 25.5 feet (B6 and B9), 30.5 feet (B7, B8, B10, and B11), and 40 feet (B13) bgs. Borings B8 and B10 were converted to groundwater monitoring wells MW4 and MW5, respectively. The borings were drilled in the following areas of the site:

1. Boring B6 was drilled southeast of the former 550-gallon east UST area.
2. Boring B7 was drilled northeast of the former 550-gallon east UST area.
3. Boring B8/MW4 was drilled north of the two former UST areas area.
4. Boring B9 was drilled at the northwest corner of the former west UST area.
5. Boring B10/MW5 was drilled south of the former UST areas.
6. Boring B11 was drilled adjacent to wells MW2 and MW9 within the former west building tank cavity.

A total of 34 soil samples were collected at five (5) foot intervals from 5.5 to 25.5 or 30.5 feet bgs. Contaminant concentrations were detected in samples collected from borings B6 (20.5 and 25.5-foot depths), B7 (20.5 to 30.5-foot depths), B8 (15.5 and 30.5-foot depths), B9 (10.5 and 15.5-foot depths), and B11 (10.5 to 30.5-foot depths). TPH-d concentrations were detected in samples B8/MW4 (15.5 and 7.2-foot depths) and B9 (10.5 and 15.5-foot depths), located adjacent to the former 1,000-gallon UST (west UST) and north of the UST areas, respectively. Up to 1,000 ppm of TPH-d was detected in sample B9-10.5'.

TPH-g concentrations were detected in samples collected from borings B6 (20.5 and 25.5-foot depths), B7 (20.5 to 30.5-foot depths), B9 (10.5 and 15.5-foot depths), and B11 (10.5 to 30.5-foot depths). TPH-g concentrations ranged from 1.1 ppm (B6-20.5') to 3,800 ppm (B11-15.5'). Boring B11 was drilled adjacent to the former 1,000-gallon UST or west UST excavation area.

BTEX concentrations were detected in six (6), six (6), 10, and nine (9) of the 34 soil samples that were collected, respectively. Maximum BTEX concentrations were also detected in sample B11-15.5' at 41 ppm, 82 ppm, 30 ppm, and 140 ppm, respectively. In addition, five (5) soil samples (one sample per boring except for boring B10) were also analyzed for MTBE. All of the MTBE results were ND. Also, all of the soil results for boring B10/MW5 were ND.

According to the groundwater samples collected from well MW4, TPH-g, TPH-d, BTEX, and MTBE concentrations were detected at 2,600 ppb, 1,800 ppb, 130 ppb, 430 ppb, 160 ppb, 470 ppb, and 62 ppb, respectively. Only MTBE (36 ppb) was detected in the sample collected from well MW5. All other results were ND.

1997

From June, 25 through July 3, 1997, site investigation (borings B12, B13, and B17) included further definition of the vertical and lateral extent of soil contamination in the areas of previous well B5/MW3 and around the locations of the former USTs. During drilling activities for boring B12, refusal was encountered at 33 feet bgs. Borings were also drilled to approximately 41.5 feet (B13) and 30 feet (B14, B15, and B16) bgs.

An additional boring (B17) was attempted three (3) to four (4) feet south/southwest of boring B2. However, refusal was encountered at approximately 32 feet bgs. Borings B14, B15, and B16 were converted to wells MW6, MW7, and MW8, respectively.

The borings were drilled in the following areas of the site:

V. ADDITIONAL COMMENTS, DATA, ETC. – continued:

1. Boring B12 was drilled three (3) to four (4) feet of boring B3/MW2 to further define the vertical extent of contamination in the former west building tank cavity area.
2. Boring B13 was drilled approximately 20 feet of boring B6 (south/southeast of the former east UST area) to define the vertical and eastern extent.
3. Boring B17 was drilled within the former west UST cavity area.
4. Boring B14/MW6 was located east of boring B13 and the former 550-gallon east UST.
5. Boring B15/MW7 was drilled west of the former west 1,000-gallon UST.
6. Off-site boring B16/MW8 was located northeast of the site.

Contaminant concentrations were detected in all of the soil samples collected from boring B12 (5 to 20-foot depths). This well was drilled three to four feet from well MW2 located in the former west UST cavity area. Maximum TPH-d, TPH-g, and BTEX concentrations were detected in sample B12-10' at 2,800 ppm, 450 ppm, 6.3 ppm, 45 ppm, 45 ppm, and 220 ppm, respectively. The results (compared to the adjacent well MW2 soil results) revealed a significant decrease in TPH-g, TPH-d, and BTEX concentrations.

All of the soil results for B16/MW8 were ND except for a TPH-d concentration of 5.0 ppm. Two (2) soil samples (B12-10' and B16/MW8-30) were analyzed for MTBE and the results were below the detection limits of 2.0 and 1.0 ppm, respectively. All of the soil results (samples collected from the 5, 10, 15, 20, 25, and 30-foot depths) for wells MW6 through MW8 were ND. In addition, all of the groundwater results (TPH-d, TPH-g, and BTEX) for wells MW6 through MW8 were ND. However, MTBE concentrations were detected in the samples collected from wells MW6 and MW8 at 120 ppb (both samples).

The investigation revealed that the contaminant soil plume beneath the former east tank area was larger in area and extended to 30 feet laterally to the west and 20 to 25 feet to the northeast. Contamination extended to approximately 25 feet bgs. The contaminant plume for the former west tank area appeared to be centered at the UST cavity and was smaller in scale compared to the east tank area.

1999

On May 18, 1999, a *Remedial Action Plan (RAP)* was submitted and approved. Proposed remediation included soil vapor extraction (SVE) and air sparging (AS) to remediate the site.

2000

The groundwater gradient was toward the northwest/west/south at 0.0005 to 0.007 ft/ft. Maximum TPH-g, TPH-d, BTEX, and MTBE concentrations were detected at 7,100 ppb (MW1), 4,700 ppb (MW1), 3,000 ppb (MW2), 3,300 ppb (MW2), 2,000 ppb (MW2), 8,000 ppb (MW2), and 280 (MW1), respectively.

2001-2007

No site assessment, groundwater monitoring, or remediation occurred at the site due to the delay in the approval of the County contract for this site.

2008-2009

In 2008, the County hired a senior environmental planner, under the Riverside Redevelopment Agency, to direct the investigation and remediation of UST sites located in Riverside County. Site activities conducted in August 2008 included well survey, groundwater monitoring, and sampling. Depth to groundwater ranged from 8.65 feet (MW-7) to 12.62 (MW-6) feet bgs. The groundwater gradient flow direction was to the west/southwest at a gradient of 0.0013 foot/foot.

Maximum TPH-g, TPH-d, BTEX, MTBE, and di-isopropyl ether (DIPE) concentrations were detected in the samples collected from well MW2 (located in the former west UST cavity area) at 14,000 ppb, 3,200 ppb, 1,500 ppb, 530 ppb, 710 ppb, 2,030 ppb, 110 ppb, and 17 ppb, respectively. In addition, 1,2-dichloroethane (1,2-DCA), n-butylbenzene (n-BB), sec-butylbenzene (sec-BB), 1,2,4-trimethylbenzene (1,2,4-TMB), 1,2,3-trimethylbenzene (1,2,3-TMB), n-propylbenzene (n-PB), naphthalene, isopropylbenzene (IPB), and p-isopropyltoluene (p-IPT) were detected in the samples collected from well MW2 at 15 ppb, 12 ppb, 11 ppb, 1,200 ppb, 250 ppb, 150 ppb, 340 ppb, 48 ppb, and 6.4 ppb, respectively.

V. ADDITIONAL COMMENTS, DATA, ETC. – continued:

Although the groundwater results for well MW-2 revealed moderate-level contaminant concentrations, overall the contaminant concentrations detected in the samples collected from this well decreased over past eight (8) years. Wells MW3 and MW7 were located down-gradient of well MW2 and the former 1,000-gallon west UST area. MTBE concentrations were detected in the samples collected from down-gradient wells MW-3 (16 ppb) and MW-7 (81 ppb). In addition, 1,2-DCA was detected in the samples collected from well MW3 at 1.1 ppb. All other results were ND.

Wells MW1 and MW5 were within and southwest (down-gradient) of the former 550-gallon east UST cavity area, respectively. Historically, low to moderate groundwater contaminant concentrations were detected in the samples collected from well MW1. The August 2008 groundwater samples for well MW1 revealed low TPH-g and VOCs concentrations at 0.31 ppb and <35 ppb, respectively. Historically, only MTBE concentrations were detected in the groundwater samples collected from down-gradient well MW5. MTBE concentrations for this well ranged from 76 ppb (October 1997) to 140 ppb (January 1999, April 1999, and July 2000). The August 2008 results revealed a decrease in the MTBE concentrations to 50 ppb.

2010

In March 2010, two (2) borings (SB1 and SB2) and one groundwater monitoring well (MW9) were drilled and completed at the site. The borings were drilled to 33 feet (MW9), 33.5 feet (SB1), and 35 feet (SB2) bgs. Drill refusal was met for boring MW9 at 33 feet. This boring was converted to a well (MW9), which was screened as a deeper well (29 to 30 feet bgs). The borings were drilled at the following areas:

1. Boring SB1 was located between the two former USTs.
2. Boring SB2 was located southeast of the former 550-gallon east UST area and near boring B13.
3. Boring MW9 was drilled within the former 1,000-gallon west UST cavity area and within five (5) feet of well MW2.

Soil samples were collected from borings MW9, SB1, and SB2 at the 25, 30, and 32-foot depths, respectively. TPH-g concentrations were detected at 0.2 ppm, 1.1 ppm, and 0.4 ppm, respectively. All of the results for TPH-d and TPH-o were ND. All of the VOCs results were either ND or less than 1.0 ppm.

Groundwater samples collected from well MW9 (20 and 30-foot depths), boring SB1 (20 and 30-foot depths), and boring SB2 (30-foot depth) and contaminant concentrations were detected in all of the samples. TPH-g concentrations ranged from 18,000 ppb (MW9-20') to 51,000 ppb (SB1-20'). TPH-d concentrations (no sample was collected from MW9-20') ranged from 680 ppb (SB1-30') to 150,000E ppb (estimated value; value exceeded calibration level of laboratory equipment; sample MW9-30'). A TPH-o concentration of 1,700 ppb was detected in sample MW9-30'.

Benzene concentrations were detected in four (4) samples and ranged from 240 ppb (SB1-30') to 6,000 ppb (SB1-20'). Toluene, ethylbenzene, and total xylenes concentrations were detected in all of the groundwater samples and maximum concentrations were detected in sample SB1-20' at 4,100 ppb, 2,800 ppb, and 7,400 ppb, respectively. Although all of the MTBE results were ND, DIPE was detected in two samples at 220 ppb (MW9-20') and 55 ppb (MW9-30').

Maximum 1,2-DCA, sec-BB, n-BB, 1,2,4-TMB, 1,3,5-TMB, n-PB, naphthalene, IPB, n-IPT, methyl-2-Pentanone, 1,1-dichloroethane (1,1-DCA), 1,2-dichloropropane, and tert-butylbenzene concentrations were detected at 85 ppb, 66 ppb, 270 ppb, 2,500 ppb, 760 ppb, 460 ppb, 1,400 ppb, 110 ppb, 83 ppb, 7.8 ppb, and 120 ppb, respectively.

In June and July 2010, site activities included the installation of one (1) monitoring well (MW10), one (1) injection point (IW1), two (2) observations wells (OB1 and OB2), and one (1) soil vapor extraction well (SVE1). During this investigation, soils consisted primarily of mixtures of silts and sands to a total depth of approximately 35 feet bgs. Groundwater was encountered at approximately 13 feet bgs.

Boring MW10 was drilled to a total depth of 35.75 feet bgs and the well was screened from 5 to 35 feet bgs. Injection well IW1 was drilled to a total depth of 31.5 feet bgs and screened from 28 to 30 feet bgs. According to the boring log for IW1, a hydrocarbon odor was noted at approximately 20 feet bgs. Borings OB1 and OB2 were drilled to total depths of 16.5 feet bgs and the wells were screened from 5 to 15 feet bgs. Well SVE1 was drilled to a total depth of 10 feet bgs and the well was screened from 4 to 9 feet bgs.

V. ADDITIONAL COMMENTS, DATA, ETC. – continued:

The borings were located at the following areas:

1. Boring/well MW10 was drilled southeast (down-gradient) of the former 550-gallon east UST and adjacent to boring SB2.
2. Injection well IW-1 was drilled south (down-gradient) of the former 1,000-gallon UST and directly south of well MW9.
3. Borings/wells OB1 and OB2 were drilled directly north and southeast of the former 1,000 gallon UST tank area.
4. Boring/well SVE1 was drilled between the two former UST areas.

Soil samples were collected from boring MW10 at the 10, 20, and 35-foot depths. All of the TPH-d results were ND. A TPH-g concentration of 38 ppm was detected in sample MW10-20'. The other two samples were ND for TPH-g.

Ethylbenzene, total xylenes, and MTBE concentrations were each detected in one sample at 0.98 ppm (20'), 1.9 ppm (20'), and 0.011 ppm (35'), respectively. Two of the three samples revealed 1,2,4-TMB concentrations at 2.1 ppm (20') and 0.0030 ppm (35'). In addition, several other VOCs were detected at either the 20 and/or 35-foot samples. However, all of the results were less than 1.0 ppm. All benzene and toluene results were ND.

Soil samples were collected from boring IW1 at the 5, 10, 15, 20, 25, and 30-foot depths. A TPH-g concentration of 1.1 ppm was detected in the 20-foot sample. All of the other TPH-g results were ND. MTBE concentrations were detected in three (3) of the samples and ranged 0.006 ppm (15') to 0.016 ppm (25'). All of the results for TPH-d, BTEX, and or other VOCs were all ND.

No soil samples were collected from borings OB1, OB2, or SVE1.

2012

In May 2012, groundwater samples were collected and analyzed. Depth to groundwater ranged from 8.90 feet in well MW-7 to 12.84 in well MW6. The groundwater gradient was to the northwest at 0.001 feet/foot. Maximum TPH-g and TPH-d concentrations were detected at 2,600 ppb (MW1) and 850 ppb (MW2). These constituents were detected in deeper screened well MW9 at 9,000 ppb and 2,900 ppb, respectively. Maximum BTEX concentrations were detected in samples collected from well MW1 at 470 ppb, 20 ppb, 190 ppb, and 72 ppb, respectively. In samples collected from deeper screened well MW9, BTEX concentrations were detected at 1,500 ppb, 140 ppb, 570 ppb, and 1,100 ppb, respectively. Maximum MTBE concentrations were detected at 71 ppb (MW10) and 37 ppb (MW9).

SENSITIVE RECEPTOR SURVEY

A Sensitive Receptor Survey was prepared and submitted to Regional Board staff on March 21, 2013. It should be noted that the site is also located within the Elsinore Fault Zone area. Sensitive receptors include the following:

Surface Water - The site is located approximately 4,000 feet northeast of Lake Elsinore. Also, the site is located adjacent to a drainage channel that flows toward Lake Elsinore. In addition, the following surface water bodies were identified:

1. The site is located approximately 4,000 feet southwest of Lake Elsinore.
2. Temescal Creek and small stream tributaries are located cross-gradient and 65 feet to the southwest of the site.
3. A reservoir is located down-gradient and 1,980 feet west/northwest of the site.

Groundwater - According to an earlier report and this survey, the nearest production well is located approximately two (2) miles to the southeast of the site. The groundwater in the deeper aquifer well (Well 21J) was measured at 240 feet bgs in December 1994. No wells were identified within a ½-mile (2,640 feet) radius of the site.

Park -Yarborough Park is located at the intersection of Flint Street and Poe Street in Lake Elsinore. The park is located cross-gradient at approximately 792 feet west/southwest of the site.

Childcare - Honore Family Childcare is located at 315 N. Flagstaff Street in Lake Elsinore. This facility is located cross-gradient at 0.16 miles southwest of the site.

V. ADDITIONAL COMMENTS, DATA, ETC. – continued:

CLOSURE

Based on the following factors, site closure is recommended for the subject site:

- On December 21, 1993, two (2) USTs were removed from the site.
- The investigations conducted at the site revealed that the contaminant soil plume beneath the former east tank area was larger in area and extended to 30 feet laterally to the west and 20 to 25 feet to the northeast. Contamination extended to approximately 25 feet bgs. The contaminant plume for the former west tank area appeared to be centered at the UST cavity and was smaller in scale compared to the east tank area. The lateral and vertical extent of the contaminant plume was satisfactorily defined for this site.
- Historically, the highest TPH-g, BTEX, and MTBE concentrations were detected in the January 1996 soil samples collected from sample B3/MW2-10' at 18,000 ppm, 81 ppm, 740 ppm, 360 ppm, 1,800 ppm, and 3.2 ppm, respectively. Historically, the maximum TPH-d concentration in the soil was detected in sample B1/MW1-10' at 15,000 ppm.

In October 1996, boring B11 was drilled adjacent to boring B3/MW2 in the former west UST area. Maximum TPH-g and BTEX concentrations were detected in sample B11-15.5' at 3,800 ppm, 41 ppm, 82 ppm, 30 ppm, and 140 ppm, respectively. In addition, sample B11-15.5' was analyzed for MTBE, which was detected at <5.0 ppm. Significant decreases in concentrations were noted in this area from 1996 and 1997.

In 1997, boring B12 was drilled three (3) to four (4) feet from boring B3/MW2 to further define the vertical extent of contamination in the former west UST cavity area. The maximum contaminant concentrations were detected in the sample collected at the 10-foot depth. TPH-g, TPH-d, and BTEX concentrations were detected in this sample at 2,800 ppm, 450 ppm, 6.3 ppm, 45 ppm, 45 ppm, and 220 ppm, respectively. Sample B12-10' was also analyzed for MTBE and the result was <2.0 ppm.

In addition, well IW1 was drilled in 2010. This well was located approximately 8 to 10 feet south of boring B3/MW2. Soil samples were collected at a five-foot interval from 5 to 30 feet bgs. TPH-g was only detected in sample IW1-20' at 1.1 ppm. MTBE concentrations were detected in samples collected at 20, 25, and 25 feet bgs at 0.005 ppm, 0.013 ppm, and 0.016 ppm, respectively. All of the results for TPH-d and BTEX were ND.

Although boring B17 was also drilled in this area, no actual soil samples were collected and analyzed. A comparison of the 1996 results (B3/MW2), 1997 results (B12), and 2010 results (IW1) confirmed significant decreases in contaminant concentrations. Therefore, the contamination detected in well MW2 appeared to be localized. Since residual contaminant concentrations remain, any change in land use will result in a soil gas survey and/or human health risk assessment (HHRA).

- Although long-term groundwater monitoring was conducted (January 1996 to May 2012), no actual soil or groundwater remediation was conducted at the site. The groundwater contamination plume was laterally and vertically defined for TPH-g, TPH-d, BTEX, and other VOCs concentrations. These compounds appeared to be localized to the areas of the two (2) former UST cavities and included wells MW1, MW2, and MW9. The MTBE plume was defined in all directions except to the west. However, well MW7 was located down-gradient to the west of the site and it was also the closest well to the adjacent channel.

In May 2012, TPH-g and BTEX results for this well were all ND. The MTBE result was 19 ppb. The latest groundwater samples were collected in May 2012. Monitoring wells MW1 through MW10 were sampled. The results are summarized below (maximum concentrations are shown in the **bold font**):

V. ADDITIONAL COMMENTS, DATA, ETC. - continued:

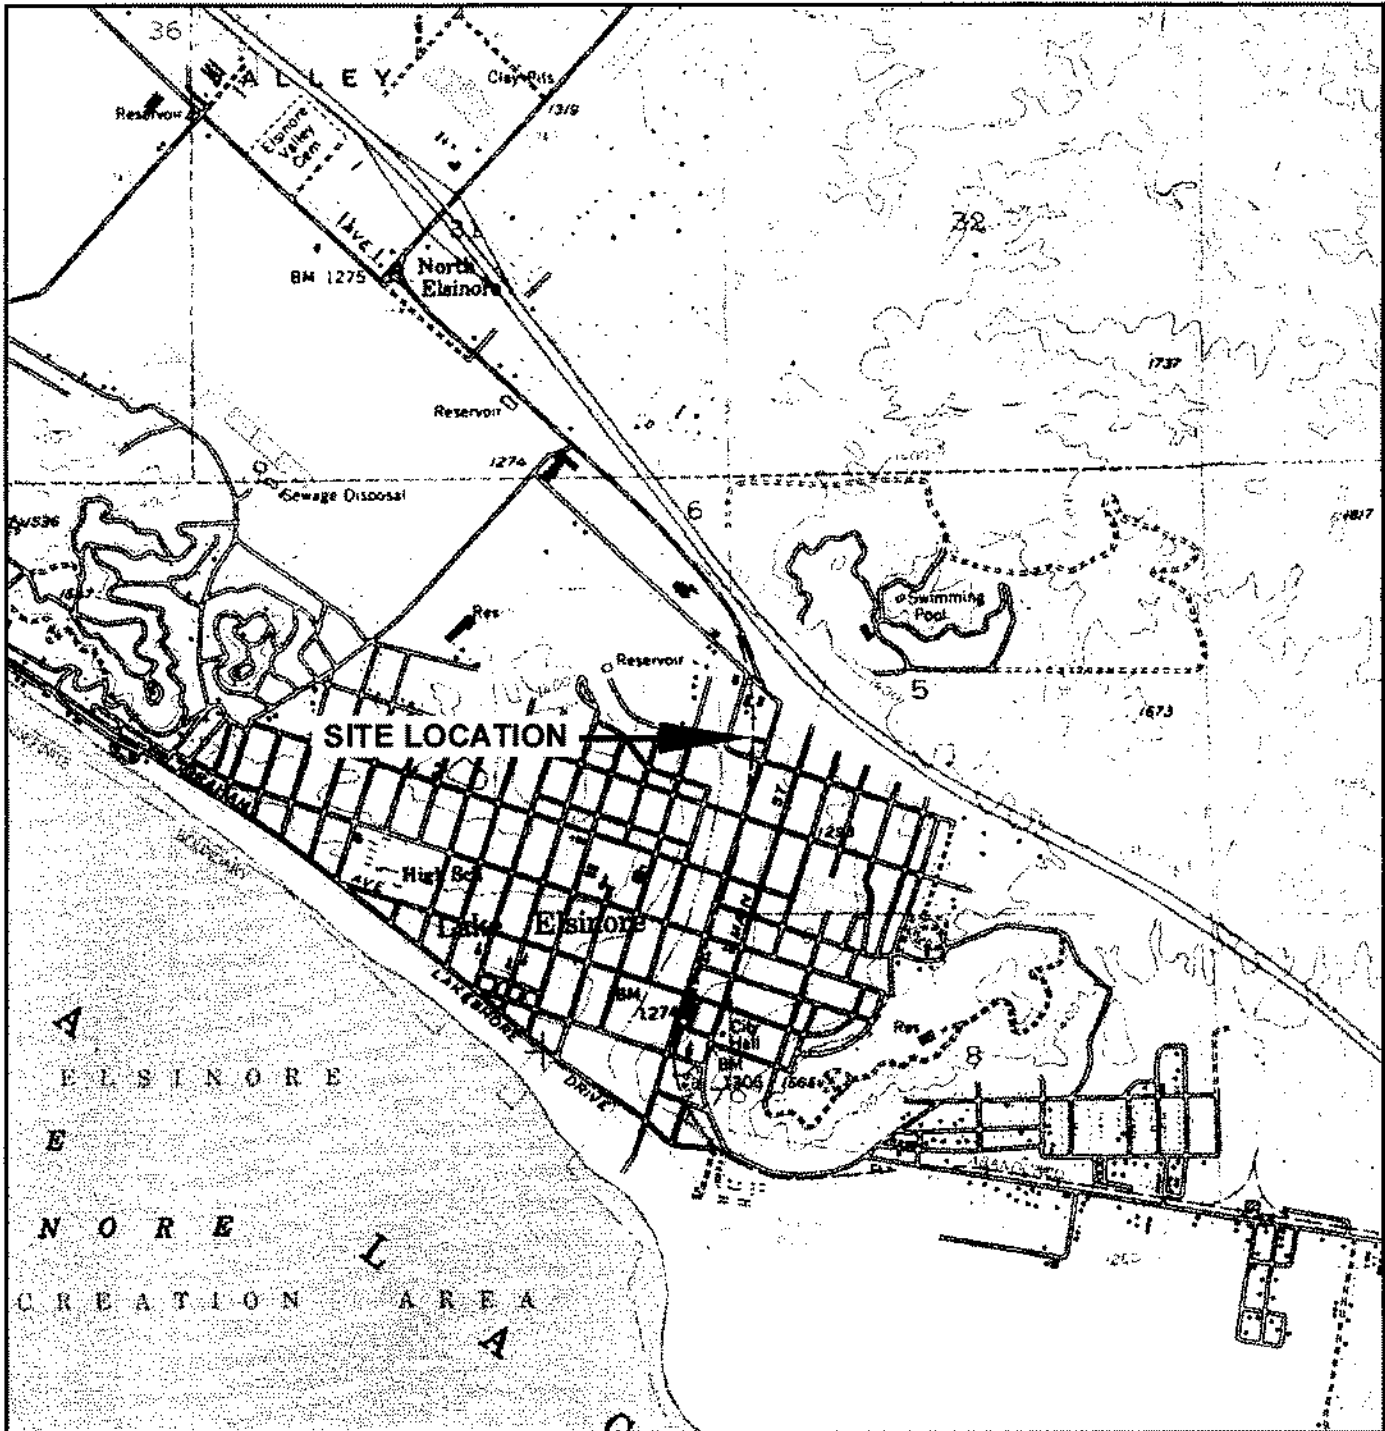

1. TPH-g concentrations were detected in four (MW1, MW2, MW9, and MW10) of the 10 wells sampled. TPH-g concentrations were detected at 2,600 ppb, 1,800 ppb, **9,000 ppb**, and 93 ppb, respectively.
2. TPH-d concentrations were detected in two (MW2 and MW9) of the 10 wells sampled at **850 ppb** and 140 ppb, respectively.
3. Benzene concentrations were detected in three (MW1, MW2, and MW9) of the 10 wells sampled at 470 ppb, 260 ppb, and **1,500 ppb**, respectively.
4. Ethylbenzene concentrations were detected in four (MW1, MW2, MW9, and MW10) of the 10 wells sampled at 290 ppb, 190 ppb, **570 ppb**, and 2.6 ppb, respectively.
5. Total Xylenes concentrations were detected in three (MW1, MW2, and MW9) of the 10 wells sampled at 72 ppb, 49 ppb, and **1,100 ppb**, respectively.
6. MTBE concentrations were detected in eight (MW1 through MW5, MW7, MW9, and MW10) of the 10 wells sampled and ranged from 6.2 ppb (MW2) to **71 ppb** (MW10).
7. 1,2,4-TMB concentrations were detected in three (MW1, MW2, and MW9) of the 10 wells sampled at 26 ppb, 98 ppb, and **900 ppb**, respectively.
8. 1,3,5-TMB concentrations were detected in two (MW2 and MW9) of the 10 wells sampled at 37 ppb and **260 ppb**, respectively. n-PB concentrations were detected in three (MW1, ME2, and MW9) of the 10 wells sampled at 25 ppb, 18 ppb, and **140 ppb**, respectively.
9. Naphthalene concentrations were detected in two (MW2 and MW9) of the 10 wells sampled at 65 ppb and 280 ppb, respectively.
10. IPB concentrations were detected in two (MW1 and MW9) of the 10 wells sampled at 10 ppb and **44 ppb**, respectively.
11. n-PB concentrations were detected in three (MW1, ME2, and MW9) of the 10 wells sampled at 25 ppb, 18 ppb, and **140 ppb**, respectively.

Therefore, dissolved phase concentrations were only localized in the former west UST cavity area. Since there are no water supply wells located within a ½ mile radius of the site, the residual groundwater contaminant concentrations shouldn't pose a threat to water quality in this area.

This closure summary does not include all of the data for this cleanup. It was prepared by Santa Ana Regional Water Quality Control Board staff for the purpose of providing a brief summary for case closure evaluation. All environmental reports pertaining to this cleanup site as well as the Regional Board case file should be reviewed in their entirety to obtain further details regarding this cleanup.

RE: Underground Storage Tank Cleanup at Big Al Oil Company located at 501 N. Spring Street in Lake Elsinore

Dear Responsible Parties:

This letter confirms the completion of site investigation and remediation for the underground storage tanks located at the above described location. Thank you for your cooperation throughout this investigation. Your willingness and promptness in responding to our inquiries concerning the underground storage tanks are greatly appreciated.

Based on the information in the above-referenced file, and with the provision that the information provided to this agency was accurate and representative of site conditions, this agency finds that the site investigation and remediation carried out at your underground storage tank site is in compliance with the requirements of subdivisions (a) and (b) of Section 25296.10 of the Health and Safety Code and with corrective action regulations adopted pursuant to Section 25299.3 of the Health and Safety Code and that no further action related to the petroleum release at the site is required.

This notice is issued pursuant to subdivision (g) of Section 25296.10 of the Health and Safety Code. If you have any questions regarding this matter, please contact Linda D. Shurlow at (760) 863-8976.

Sincerely,

Gary Root
Director, Environmental Health

VII. Additional Comments, Data, Etc.

On January 10, 1991, four UST's were removed at the above referenced site: One 10K diesel, two 6K gasoline, and one 6K diesel. Contamination was evident from soil samples taken beneath the fill and of the 6K diesel tank. The contamination was minimal and the excavation was enlarged to remove affected soils. Confirmation soil samples on the bottom and 3 of the walls were ND for TPH and BTEX however the north wall showed 503 ppm TPH and ND benzene.

A total of 40 cubic yards were removed and stockpiled on site. This soil was placed on visquene for bioremediation. Bioremediation continued to April of 1995. On April 4, 1995 confirmation samples of the biocell were taken. All four samples taken came back nondetect. No further treatment of the stockpiled soil was required however further soils investigation to the north of the excavation was necessary.

On July 31, 1998, 7 geoprobe borings were drilled to a maximum of 20' and sampled every 4'. Water was encountered at 17'. Up to 3000 ppm TPHg, 7100 ppm TPHd, 1.3 ppm benzene, and 5.8 ppm MTBE was detected in the soil. Water grab samples were taken. Up to 21000 ppb TPHg, 9 ppb benzene and 26 ppb MTBE was detected.

On March 31, 1999, three groundwater monitoring wells were installed. Soil samples from wells 1 and 2 were ND for TPHg. Well three had 830 ppm TPHg at 5'. Well 1 had 0.02 ppm MTBE at 15', well 2 had 0.018 ppm at 15' and 0.1 ppm at 20'. Well 3 was ND for MTBE. No benzene was detected in any sample. Groundwater samples were taken on March 31, 1999 and showed 2,100 ppb TPHg in well 1, 600 ppb in well 2 and ND in well 3. Well 1 had 2,100 ppb MTBE, well 2 had 170 ppb and well 3 had ND MTBE. No benzene was detected in any well. On April 2, 1999, the three wells were again sampled. Well 1 and 3 were ND for TPHg and well 2 had 600 ppb TPHg. Well 1 had 190 ppb MTBE and 1 ppb benzene. Well 2 had 180 ppb MTBE and ND benzene. Well 3 had ND MTBE and benzene.

On January 28 to 31, 2000, a dual phase pilot test was conducted utilizing the existing three monitoring wells. On December 12 and 13, 2001, three sva wells and one monitoring well were installed. Up to 1300 ppm TPHg, 2300 ppm TPHd, 0.0029 ppm benzene and 0.690 ppm MTBE were detected in the soils. Up to 3,800 ppb TPHg, ND benzene and 95 ppb MTBE was detected in the groundwater.

On November 12, 2003, 20 soil samples were taken beneath the former dispensers and piping. Up to 18,000 ppm TPHd, 1.6 ppm TPHg, 0.024 ppm MTBE and ND benzene detected in the soils. From November 21 to 26, 2003, 2000 cubic yards of contaminated soils were excavated beneath the contaminated dispensers and taken to Thermal Rem Solutions in Azusa. Confirmation sampling on December 1, 2003 showed ND TPHg and MTBE and 0.06 ppm benzene.

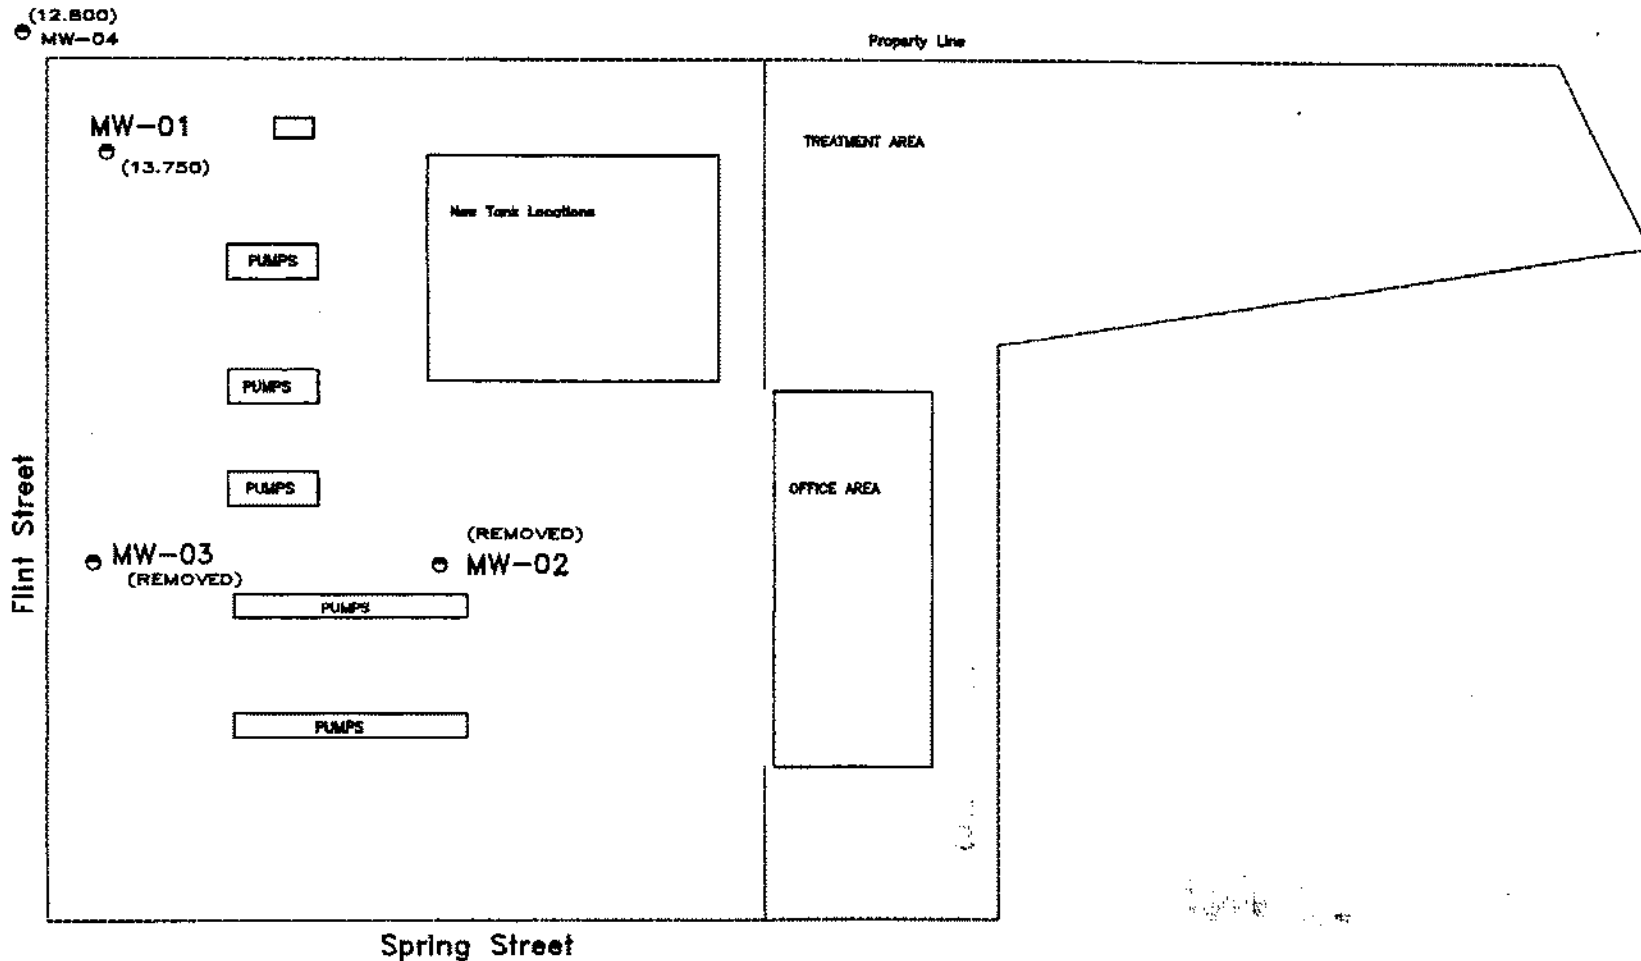

Two of the four groundwater monitoring wells were destroyed during the excavation. Well 2 had ND TPHg and BTEX and 170 ppb MTBE during its last sampling event. Well 3 had ND TPHg and BTEX and 3.3 ppb MTBE during its last sampling event. The two remaining wells were downgradient wells.

Wells 1 and 4 have had ND TPHg and BTEX since 2001. MTBE has decreased from 690 ppb to ND in well 1 and from 120 to 9 ppb in well 4. The consultant is requesting no further sampling or quarterly reporting be completed due to the low levels of MTBE reported over the last three years.

Closure was approved once the monitoring wells were destroyed. Both wells were destroyed October 3, 2005.

**RE: Underground Storage Tank (UST) cleanup
76 Products Facility #6035
515 N. Main Street
Lake Elsinore, California
Riverside County LOP # 200117545**

Dear Responsible Parties:

This letter confirms the completion of a site investigation and corrective action for the underground storage tank(s) located at the above described location. Thank you for your cooperation throughout this investigation. Your willingness and promptness in responding to our inquiries concerning the underground storage tank(s) are greatly appreciated.

Based on the information in the above-referenced file, and with the provision that the information provided to this agency was accurate and representative of site conditions, this agency finds that the site investigation and corrective action carried out at your underground storage tank(s) site is in compliance with the requirements of subdivisions (a) and (b) of Section 25296.10 of the Health and Safety Code and with corrective action regulations adopted pursuant to Section 25299.3 of the Health and Safety Code and that no further action related to the petroleum release(s) at the site is required.

Claims for reimbursement of corrective action costs submitted to the Underground Storage Tank Cleanup Fund more than 365 days after the date of this letter or issuance or activation of the Fund's Letter of Commitment, whichever occurs later, will not be reimbursed unless one of the following exceptions applies:

- Claims are submitted pursuant to Section 25299.57, subdivision (k) (reopened UST case); or
- Submission within the timeframe was beyond the claimant's reasonable control, ongoing work is required for closure that will result in the submission of claims beyond that time period, or that under the circumstances of the case, it would be unreasonable or inequitable to impose the 365-day time period.

This notice is issued pursuant to subdivision (g) of Section 25296.10 of the Health and Safety Code. If you have any questions regarding this matter, please contact Sharon Boltinghouse at (951) 955-8982.

Sincerely,

Steve Van Stockum
Director, Environmental Health

CASE CLOSURE SUMMARY

LEAKING UNDERGROUND FUEL STORAGE TANK PROGRAM

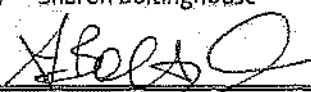

SITE NAME: 76 Former Service Station #6035

SITE #: 200117545

Assessment:

December 2001: Four soil borings (B-1, B-2, B-3 and B-4) were advanced near the southern dispenser islands where soil staining and impacted soils were encountered. Groundwater (GW) was encountered at approximately 41 feet below grade (ft bg), so three of the four borings were completed as GW monitoring wells (B-2/MW-1, B-3/MW-2 and B-4/MW-3). Soil samples from B-2/MW-1 (closest to the eastern dispensers) were impacted with the highest concentrations at 30 ft bg: 3400 ppm TPHg, 6.2 ppm B, 140 ppm T, 51 ppm E, 480 ppm X, ND oxygenates. GW concentrations in wells MW-2 and MW-3 were low to non-detect (ND), however, MW-1 had detections of: 1200 ppb TPH-g, 480 ppb B, 1500 ppb T, 1800 ppb X, and ND oxygenates. Several VOCs were also detected (910 ppb 1,2,4-TMB, etc.).

August 2004: Three on-site monitoring wells (MW-5, MW-6 and MW-7) were installed south, west, and north of the dispenser islands and one off-site monitoring well (MW-4) was installed east of the dispensers. Soil samples from the four well locations were at or below the detection limits. GW samples collected from the new wells showed elevated concentrations only in well MW-6 (1700 ppb TPPH, 150 ppb B and <20 ppb TXE & MTBE). Additionally, liquid-phase hydrocarbons (LPH) were observed in well MW-1 (0.01 ft) located in the source area between the two eastern dispenser islands. LPH were observed in this well September 2004 and December 2004.

August 2006: Eight (8) air sparge (AS-1 through AS-8) wells, four (4) SVE wells (VEW-1 through VEW-4), and two (2) groundwater monitoring wells (MW-8 and MW-9) were installed after dual-phase extraction (DPE) pilot testing was conducted in October 2005 and January 2006. Wells VEW-1 through VEW-4 were completed with screens from 10 to 30 ft bg. Based on the findings, the extents of soil and GW impacts at the site had been adequately delineated and were primarily located in the area of the dispenser islands.

Remediation

1989 Remedial Excavation: It was reported that 220 cubic yards of soil was removed from the site during the 1989 UST replacement activities (*Closure Request Report*, AECOM, October 30, 2013).

2000 Remedial Excavation: During the September 2000 product piping replacement and dispenser upgrades, a total of 41.74 tons of impacted soil was removed and recycled at TPS in Adelanto.

October 2005 & January 2006 Dual-Phase Extraction (DPE) Remediation Events: Two 5-day mobile DPE events were conducted utilizing wells MW-1, MW-3, and MW-6 to extract vapors and groundwater. The radius of influence of the vapor extraction was calculated to be 30 ft. The October 2005 DPE event removed 70.60 lbs. of vapor-phase hydrocarbons and 27,040 gal of GW. The January 2006 DPE event removed 90.63 lbs. vapor-phase hydrocarbons and 20,660 gal of GW. Due to the large amount of water generated, air-sparge was later proposed and implemented to reduce GW hydrocarbon concentrations.

January 2009 to May 2013 Soil Vapor Extraction (SVE) Remediation: A SVE system extracted vapors from wells VEW-1 through VEW-4 from January 2009 to January 2010 and from October 2010 to May 2013. A cumulative total of 25,393 lb TPH-g, 476.8 lb B, 1381 lb T, 114.65 lb E, 735 lb X and 162.6 lb MTBE were removed and treated during this time.

March 2009 to November 2011 Air Sparge (AS) Remediation: An AS system operated from March 2009 to January 2010 and again from October 2010 to November 2011 utilizing wells AS-1 through AS-8. The temporary system shut down for South Coast Air Quality Management District (SCAQMD) permit renewal. The system operated a total of 17,195 hours.

CASE CLOSURE SUMMARY

LEAKING UNDERGROUND FUEL STORAGE TANK PROGRAM

SITE NAME: 76 Former Service Station #6035

SITE #: 200117545

Groundwater Monitoring:

GW monitoring was initiated in 2001 following the installation of MW-1 through MW-3. Historical depth to GW have fluctuated between approximately 29 to 41 ft bg and is currently 38 to 40 ft bg. From 2001 to 2005, GW elevation rose approximately 10 feet. Since 2005, GW elevations have fallen to pre-2005 elevations. The GW flow direction has been primarily to the west and southwest at 0.001 ft/ft. LPH was observed at a thickness of 0.01 ft in MW-1 Q3 2004 and Q4 2004.

The lateral extent of hydrocarbons in the GW is limited to the vicinity of the dispenser islands. Highest concentrations have been in well MW-1 with 0.01 ft LPH (2004), 89000 ppb TPH, 2500 ppb B, 16000 ppb T, 13000 X, 2700 ppb E, 110 ppb MTBE. Benzene and MTBE have been below drinking water maximum contaminant Levels (MCLs) of 1 µg/l and 13 µg/l respectively, since 2009. Recent maximum GW concentrations were: 1200 ppb TPHg (MW-1), ND<0.083 ppb B (All wells), ND TXE, ND<0.11 ppb MTBE, and ND<9.4µg/L TBA.

Verification:

Soil verification: Confirmation soil borings CB-1 and CB-2 were advance to 50 ft bg and 10 ft bg, respectively. Soil samples were analyzed from each 5-ft depth interval. All samples were at or below the laboratory detection limits for TPHg, BTXE, and oxygenates.

Vapor verification: A SVE rebound test was conducted from May 13 through 17, 2013 using wells VEW-1, VEW-2, VEW-3, and VEW-4. Vapor samples were collected from each well and the combined system influent at system restart, after 2 hours of operation, after 8 hours of operation, after 24 hours of operation and daily thereafter. Results showed the highest vapor concentrations of 2.3J ppmv TPH-g, ND<0.0054 ppbv benzene, 0.45 ppbv toluene, 0.19 ppbv ethylbenzene, 1.2 ppbv total xylenes, ND<0.0096 ppbv MtBE. The SVE influent mass removal rate at shutdown on April 9, 2013, was 1.16 pounds per day. The mass removal rate for influent samples collected from May 13 through May 17, 2013, ranged from 0.08 to 0.53 pounds per day.

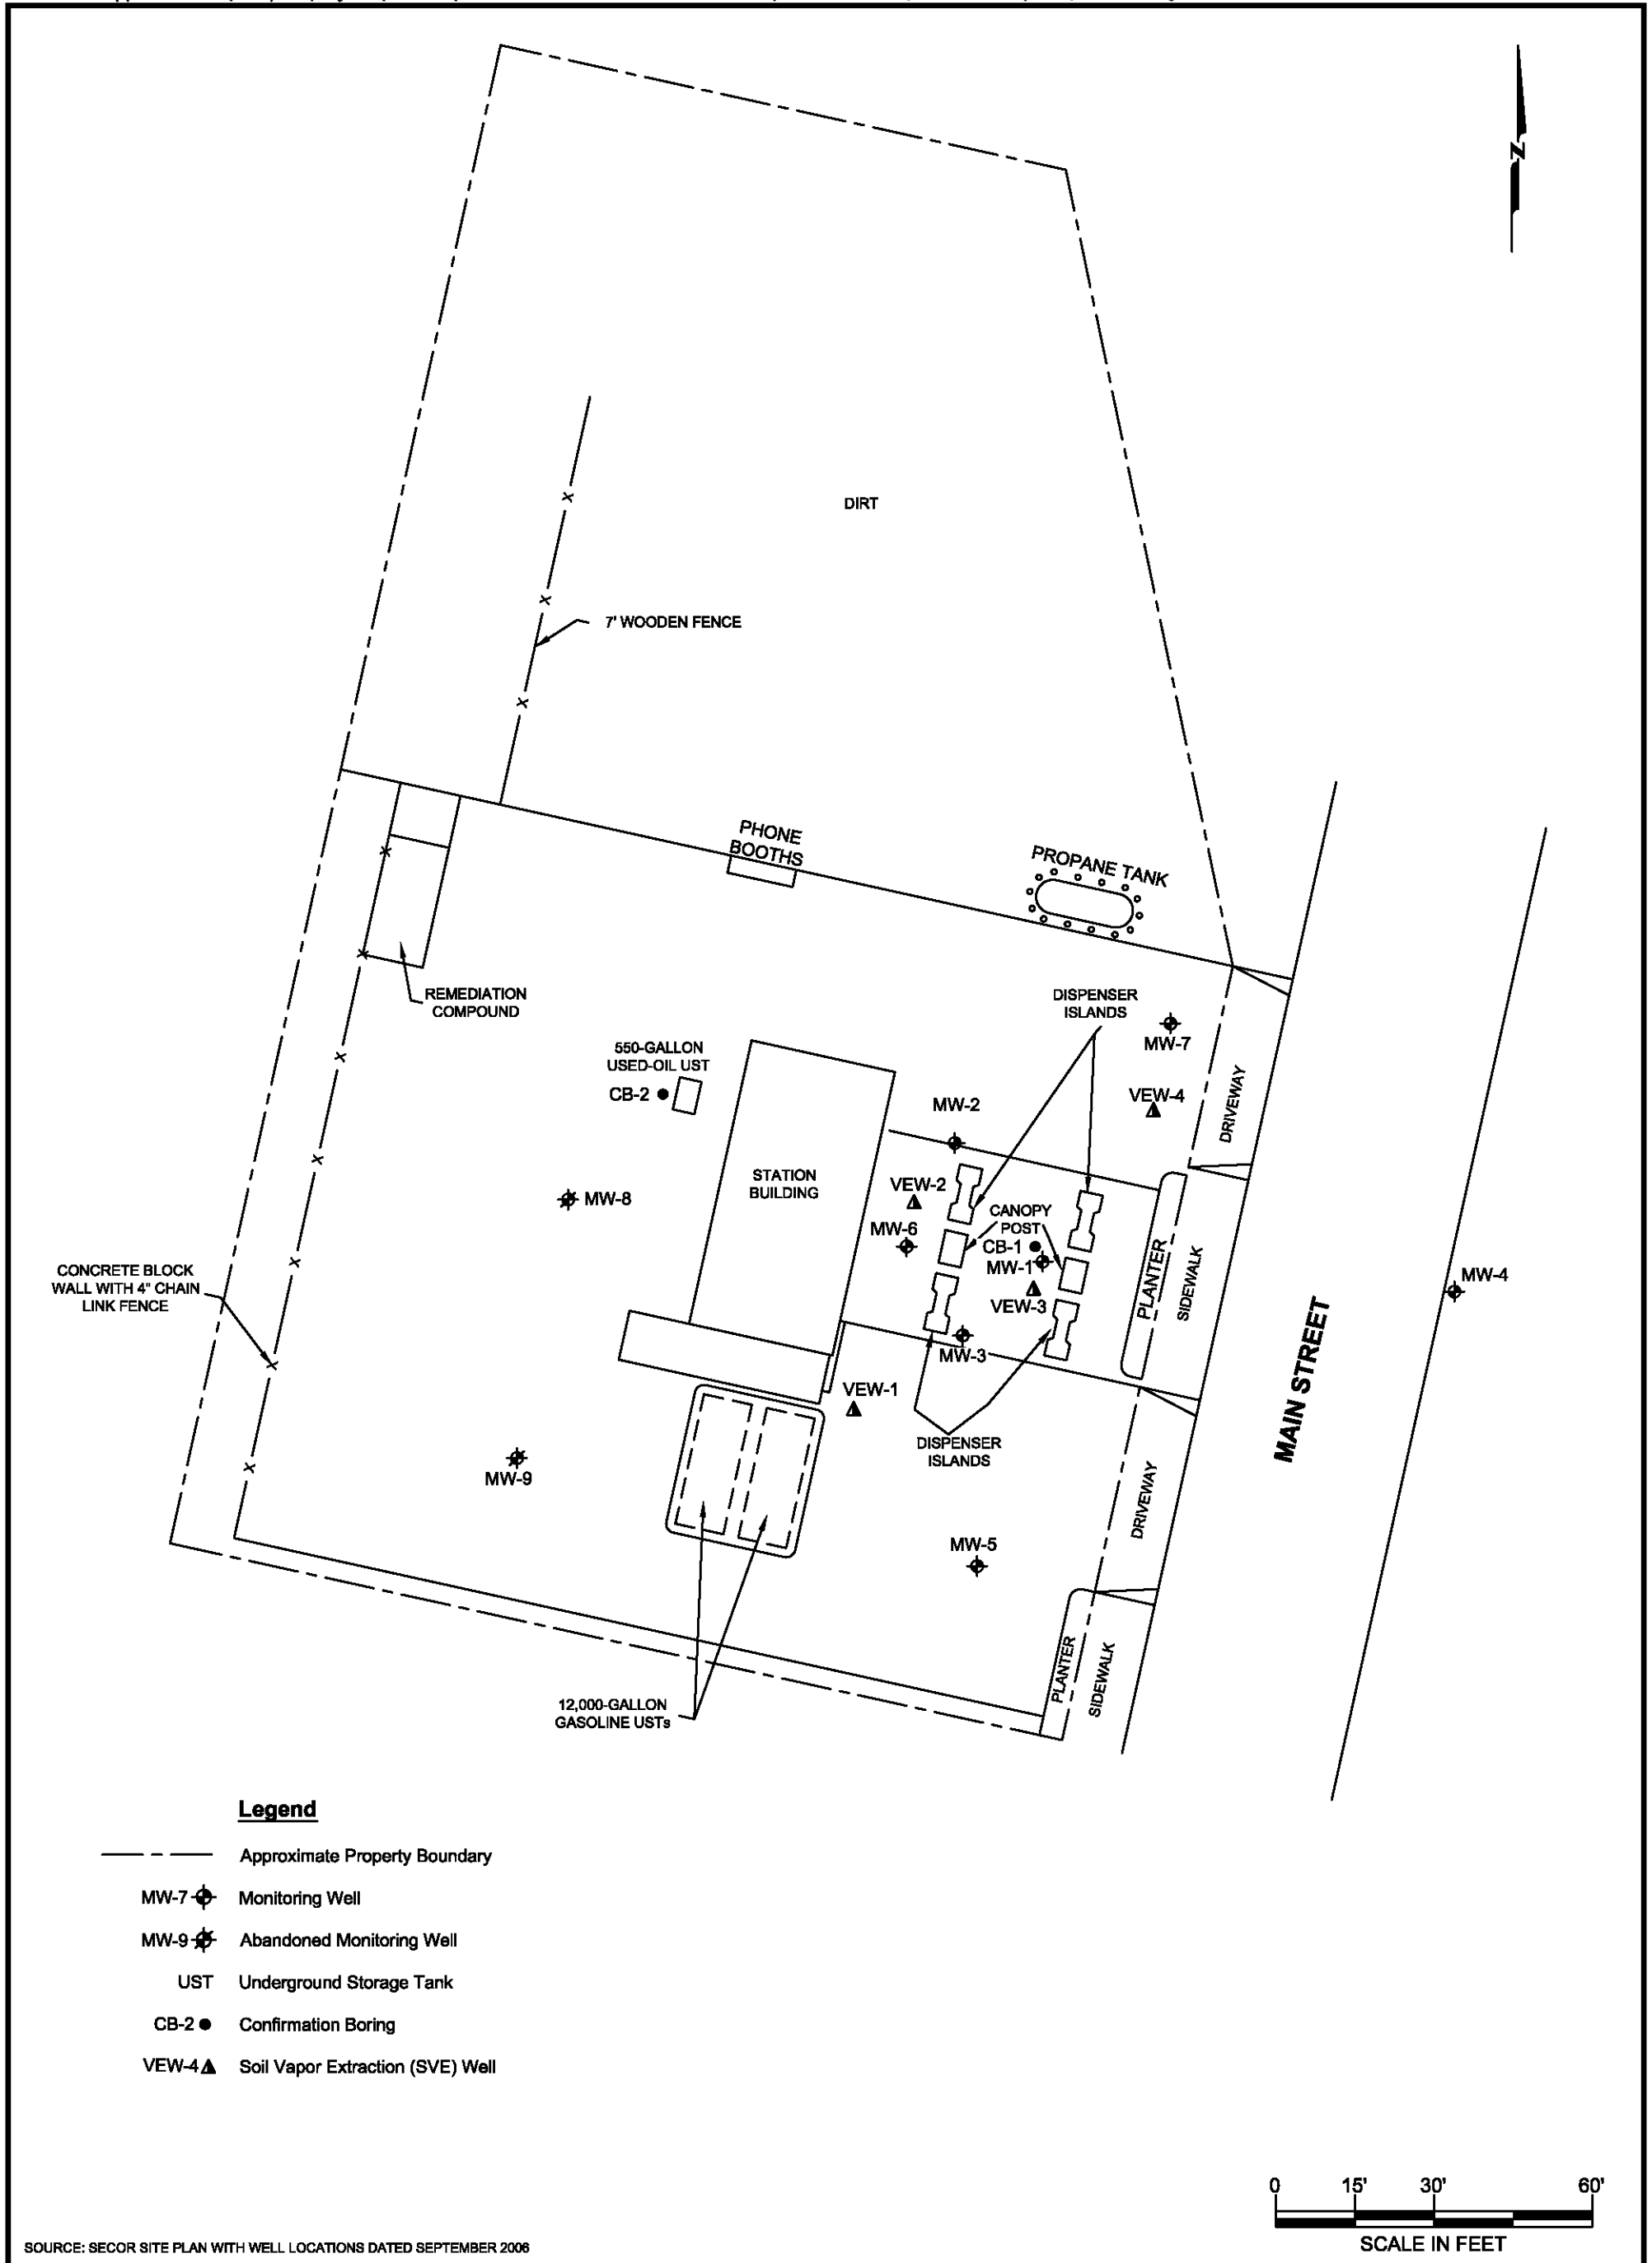

Groundwater verification: Based on GW monitoring data, benzene and MTBE have been below drinking water MCLs of 1 and 13 µg/l, respectively, since at least 2009. LPH has not been observed in any of the wells since 2004. The lateral extent of hydrocarbons in GW is limited to the vicinity of the dispenser islands and is defined by analytical results below laboratory detection limits. TPHg is present only in MW-1 (1200 ppb) and shows a decreasing trend. Laboratory analytical results for a GW grab sample collected from CB-1 detected 170 ppb TPH-g and 0.18J ppb B. MTBE and TBA were not detected.

Other information:

Land Use: The site is currently a vacant, fenced former 76-brand gasoline service station located near the southwestern corner of the intersection of Main Street and Interstate 15 in Lake Elsinore, California. The site vicinity consists of vacant, residential and commercial properties. Plans for property redevelopment for service station use are in progress.

Sensitive Receptors: Elsinore Elementary School: 0.4 mile southwest; Church of Christ: 0.4 mile south; Lake Providence Baptist Church: 0.23 mile southwest; First Lutheran Church: 0.5 mile southwest; First Christian Church: 0.5 mile southwest; Yarborough Park: 0.3 mile west. The nearest surface water body is Lake Elsinore, located 0.9 mi southeast of the site. The nearest surface water body is Temescal Wash, a concrete-lined flood control channel, located 1,000 feet west of the site.

NOTE: This closure summary does not include all of the data for this cleanup. It was prepared by the Riverside County DEH for the purpose of providing a brief summary of the cleanup case. The *Closure Request Report* (AECOM, October, 30, 2013) and the RCDEH case file should be reviewed to obtain further details regarding this cleanup.

Mr. Dennis Welch
City of Lake Elsinore
130 S. Main Street
Lake Elsinore, CA 92330

Dear Mr. Welch:

Based on information currently known to the County of Riverside, Department of Health, it has been determined that all acceptable remedial practices were performed at the site. No additional investigation, remediation, or monitoring of hazardous wastes or substances is required at the site.

Nothing in this determination shall constitute or be construed as a satisfaction or release from liability for any conditions or claims arising as a result of past, current, or future operations of the City of Lake Elsinore. Nothing in this determination is intended or shall be construed to limit the rights of any parties with respect to claims arising out of or relating to deposit or disposal at any other location of substances removed from the site. Nothing in this determination is intended or shall be construed to limit or preclude the County of Riverside, Department of Health or any other agency from taking any action authorized by law, including, but not limited to, any further enforcement actions. Notwithstanding compliance with any previous directives, the City of Lake Elsinore may be required to take further actions as are necessary to protect public health and the environment.

If you have any questions, do not hesitate to contact this office at (714) 358-5055.

Sincerely,

Wendy Sheridan
Hazardous Materials Specialist

SUBJECT: SITE STUDY FOR THE SITE LOCATED AT 521 NORTH LANGSTAFF
STREET, IN LAKE ELSINORE, CALIFORNIA.

Gentlemen:

Pursuant to your request, we have visited the above referenced project
and performed a site study.

The accompanying report includes our findings from subsurface
exploration, field observation, the results from laboratory testing,
and our opinion based on the findings. This report is for the use of
the above referenced client and the property project only. No other
warranties are expressed or implied.

If we can be of further assistance, please contact our office at your
convenience.

Sincerely,

FOR ACADEMY GEOTECHNICAL ENGINEERING

FINAL REPORT
FOR 521 NORTH LANGSTAFF STREET
LAKE ELSINORE, CALIFORNIA

INTRODUCTION

Subject and Purpose

This document presents the Final Report and results of the observances and testing on the underground contamination at the City of Lake Elsinore, City Yard, at 521 North Langstaff Street, in Lake Elsinore, California. Academy Geotechnical Engineering was authorized by Mr. Dennis Welsh to perform this site study.

Background

The subject site has been the location of the Lake Elsinore City yard since the early 1900's. The site had 4 steel underground storage tanks installed over 20 years ago (see the Plot Plan for the approximate locations), and a 55 gallon drum aboveground storage area for solvents. The 4 underground storage tanks were used as follows: tank #1 is a 3,000 gallon diesel fuel; tank #2 is a 1,000 gallon regular gasoline tank; tank #3 is a 1,000 gallon unleaded gasoline tank, and tank #4 was out of service, but is believed to have held diesel fuel and unleaded gasoline.

On May 13, 1987, tanks #1, 2, and 3 were tested by this firm for leaking using the Horner Ezy Chek Method. Tank #3 failed the test with a leak rate of -1.0814 gals./hr. Both the product and vent lines were replaced and the system was retested on May 28, 1987 and was found to be tight.

Tank #4 was permitted for abandonment by removal, and was removed by Allied Environmental Management on December 9, 1987. At that time, it was determined by the County of Riverside, Department of Health Services that the site required further subsurface investigations for contamination. The laboratory analysis of the soil samples was obtained by using EPA Test Method 418.1 indicating contamination of 11000 ppm TPH (Total Petroleum Hydrocarbon), at a depth of 7 feet.

On April 27, 1988, a site study was performed by this office to determine the extent of subsurface contamination that had traveled down to a depth of approximately 23 feet, at which point probable bedrock was encountered. At this point, the contaminant migrated in a northerly direction for approximately 85 feet, at a depth of 10 to 24.5 feet. The contaminant had migrated east and west to include the soil up to the mechanic shop and under the storage building.

On August 18, 1988, the three remaining fuel tanks had been removed and the removal of the contaminated soil started with the approval of Riverside County Health Department. The excavation was monitored with a Foxboro 128 OVA to determine when all soils with a contamination level of >10 ppm had been removed.

On September 21, 1988, the maximum extend of contamination, had been removed and placed in the proposed area behind the equipment

storage building. Under the direction of Steve Stites, of Riverside County Health Department, the excavation was again checked with the Foxboro 128 OVA and two soil samples were obtained. These samples were tested by E.S. Babcock Lab, Riverside, California, with both samples having a result of <10 ppm using EPA test method 8015 (see Plot Plan for maximum extent of exploration and sample location).

The prepared area behind the Equipment Storage Building (see Plot Plan) had a minimum of 4 inches of asphalt with a 6 inch asphalt berm around its perimeter. These soils were spread, moisturized and disced by the Lake Elsinore personnel daily until a contamination level of <100 ppm, organic vapor could be detected.

On February 15, 1989, under the direction of Steve Stiles, four random, composite samples were obtained from the removed soils and tested by Babcock Lab with the results having a maximum of 33 ppm, with samples 5-3. (See test results table.)

General Geology and Hydrology

The area towards the north and east of Lake Elsinore is composed of marine sedimentary and metasedimentary rock, phyllites, schists, and gneisses. The upper soils at the site are of recent alluvium, unconsolidated stream and alluvial fan deposits, with decomposed granite. They are brown silty clayey SANDS and silty SANDS, fine to medium grain.

Elevated bedrock hills adjoin the site on the northeast and northwest with associated faulting towards the south. The localized hydrogradient is towards the north, while surface drainage is shallow tends to be in a southwesterly direction, and lake level related.

The lake water and surrounding water wells are used for municipal, agricultural, and recreational purposes.

According to the Riverside County Flood Control well records, groundwater would not be expected before a minimum depth of 40 feet. The wells within 1 mile of the project site have an average groundwater depth of 65 feet.

Site Description

The site is a quarter circle shape and approximately 11.75 acres. It is a maintenance and storage facility for the Lake Elsinore City Equipment. It has a relatively flat terrain with scattered vegetation and surface drainage in a north to northeast direction. There is a chain link fence around the total perimeter of the property. There are four structures on the site and they are as follows: Administration Building, Equipment Storage Building, Mechanics Shop and a Supply Storage Building (see plot plan for locations). The southeast end of the mechanics shop and the supply building were removed in order to allow the removal of the underground storage tanks and contaminated soils.

FIELD EXPLORATION

On August 18, 1988, the removal of contaminated soils started. The operation was monitored with both an Exotox gas monitor, model 40-OF, and a Foxboro OVA 128 GC. A small track hoe was used to develop the excavation with the excavated soil being moved by dump truck to the soil storage area.

The excavation started on the south end of the tank removal area until the Foxboro OVA indicated <10 ppm, showing the maximum southern mitigation. The excavation was then developed virtually to a depth of 25 feet. At this depth, rock was encountered. The excavation then proceeded northward until the Foxboro OVA 128 GC initiated readings of <10 ppm. At this point the excavation had a width of approximately 45 feet, length of 85 feet and a depth of 25 feet.

On September 21, 1988, under the direction of Steve Stites, Riverside County Health Department, the excavation was surveyed with the Foxboro 128 GC (see field analysis) and two soil samples were obtained (see lab and chemical analysis).

Approximately 3,500 cubic yards of soils was removed from the excavation. The contaminated soil was spread, disced and moisturized until readings of <100 ppm were detected with the Foxboro 128 GC using the field analyzer method. Air test results using the Air Quality Management Districts methods were an average of 35 to 40 ppm.

FIELD EXPLORATION, continued

The soils encountered were logged continuously by personnel from this office.

The field exploration consisted of:

A: NUMBER OF EXCAVATIONS: 1

B: MAXIMUM DEPTH OF EXCAVATION: 25 feet

Based on our findings, the soils encountered were basically sedimentary. Classification is predominantly:

A: SOIL ENCOUNTERED: clayey silty SAND

B: GROUNDWATER DEPTH: NONE TO DEPTH EXPLORED

C: BEDROCK DEPTH: 25 feet

SOIL SAMPLES FOR FIELD ANALYSIS

Prior to their use, all sampling equipment and containers were pre-cleaned with a steam cleaner producing a temperature of 306 degrees fahrenheit with 1400 psi pressure.

All samples for field analysis were taken from the excavation and poured into clean half pint jars until they had approximately 50 ml of soil. The jar was then filled with deionized waters to approximately 100 ml, covered with aluminum foil, the lid ring placed on, and was shook to wash hydrocarbons from the soil. The samples were then allowed to sit in the sun a minimum of 10 minutes before analysis was performed.

FIELD ANALYSIS RESULTS

On September 20, 1988, field analysis was performed by aspirating the air from the field sample using the Foxboro OVA 128 GC. Results are as follows:

<u>SAMPLE I.D.</u>	<u>LOCATION</u>	<u>RESULTS</u>
F-1	SOUTH SIDE	3.0 PPM
F-2	SOUTHEAST SIDE	1.3 PPM
F-3	EAST SIDE	0.8 PPM
F-4	NORTHEAST SIDE	0.8 PPM
F-5	NORTH SIDE	0.4 PPM
F-6	NORTHWEST SIDE	3.1 PPM
F-7	WEST SIDE	1.5 PPM
F-8	SOUTHWEST SIDE	3.4 PPM

SOIL SAMPLES FOR LABORATORY ANALYSIS

A total of 6 samples were obtained from the project site. Four composite samples were taken from the area of land farming and 2 grab bag samples from the excavation. For the approximate location, see the enclosed plot plan. The samples are identified as follows: S-1, S-2, S-3 and S-4.

The samples were placed in clear glass jars, and sealed by placing aluminum foil over the mouth of the jar. They were then placed on ice for transport to Edward S. Babcock & Sons, Incorporated, (see the enclosed Chain of Custody form).

LABORATORY CHEMICAL ANALYSIS

A total of 6 samples were analyzed for total petroleum hydrocarbons. The types of chemical analysis and results are as follows:

<u>DATE</u>	<u>SAMPLE I.D.</u>	<u>TEST TYPE</u>	<u>PERIMETER</u>	<u>RESULTS</u>
09-22-88	S-1	EPA METHOD 8015-5030	PURGEABLE HALOCARBONS AND AROMATICS	\$10 PPM
09-22-88	S-2	"	"	\$10 PPM
02-16-89	S-1	"	"	ND
02-16-89	S-2	"	"	26 PPM
02-16-89	S-3	"	"	33 PPM
02-16-89	S-4	"	"	10 PPM

*ND = NONE DETECTED

CONCLUSION AND RECOMMENDATIONS

It is our reserved opinion, within the limits of this study, that this site probably has been contaminated only by the underground storage tank that was removed. The migration of this contamination was downward to a depth of approximately 25 feet before rock was encountered. Lateral contamination extended east to west for 45 feet and south to north for 85 feet.

The excavation to remove contaminated soils has removed all soils with levels above 10ppm THC (as shown in field test and laboratory chemical analysis). The contaminated soil which was removed appears to have reduced to levels below 50 ppm. Due to all contamination dealt with on the site being mitigated with in all State, County and local requirements, no further action is recommended.

LIMITATIONS

Our conclusions and recommendations are based solely on the results of field explorations and laboratory testing. If soil conditions or contamination is encountered during any future project, demolition, project grading, or at any other time that differs substantially from those described in this report, this office should be notified immediately so that appropriate recommendations can be made.

This office will be further available to assist in assuring correct interpretation of this report's conclusions and recommendations.

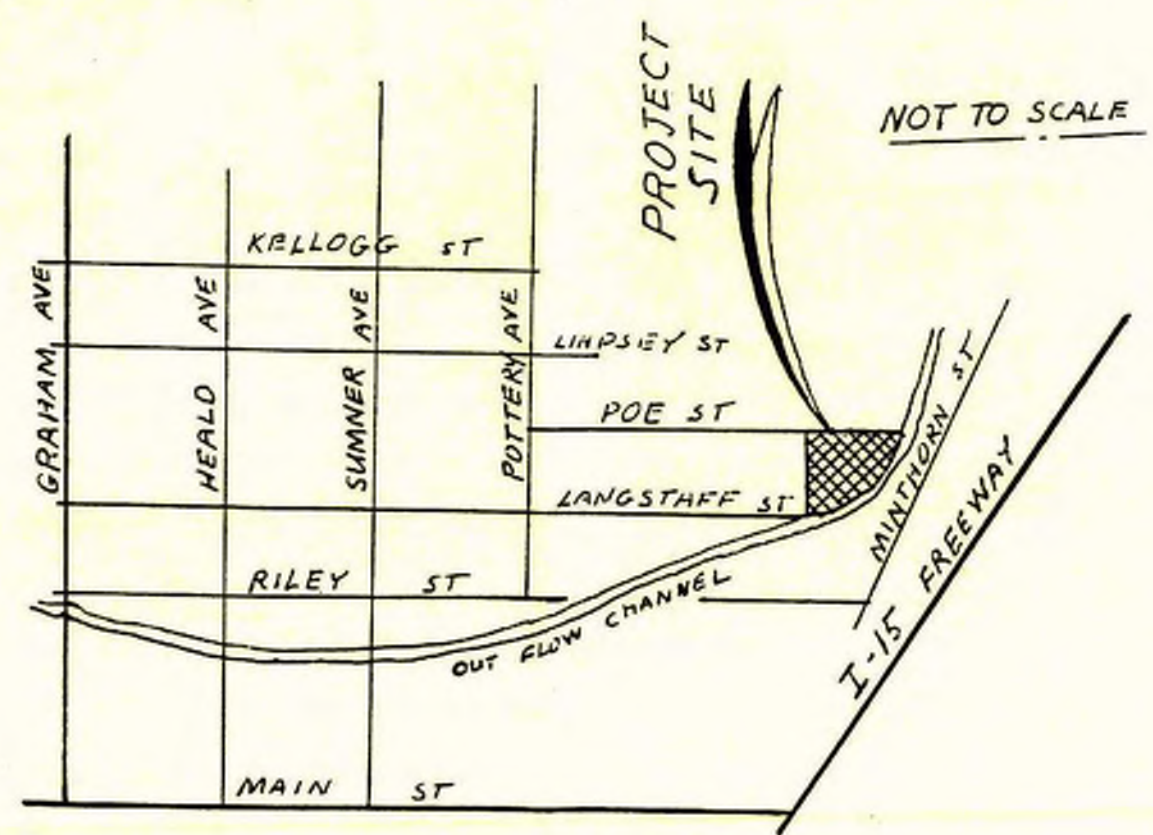

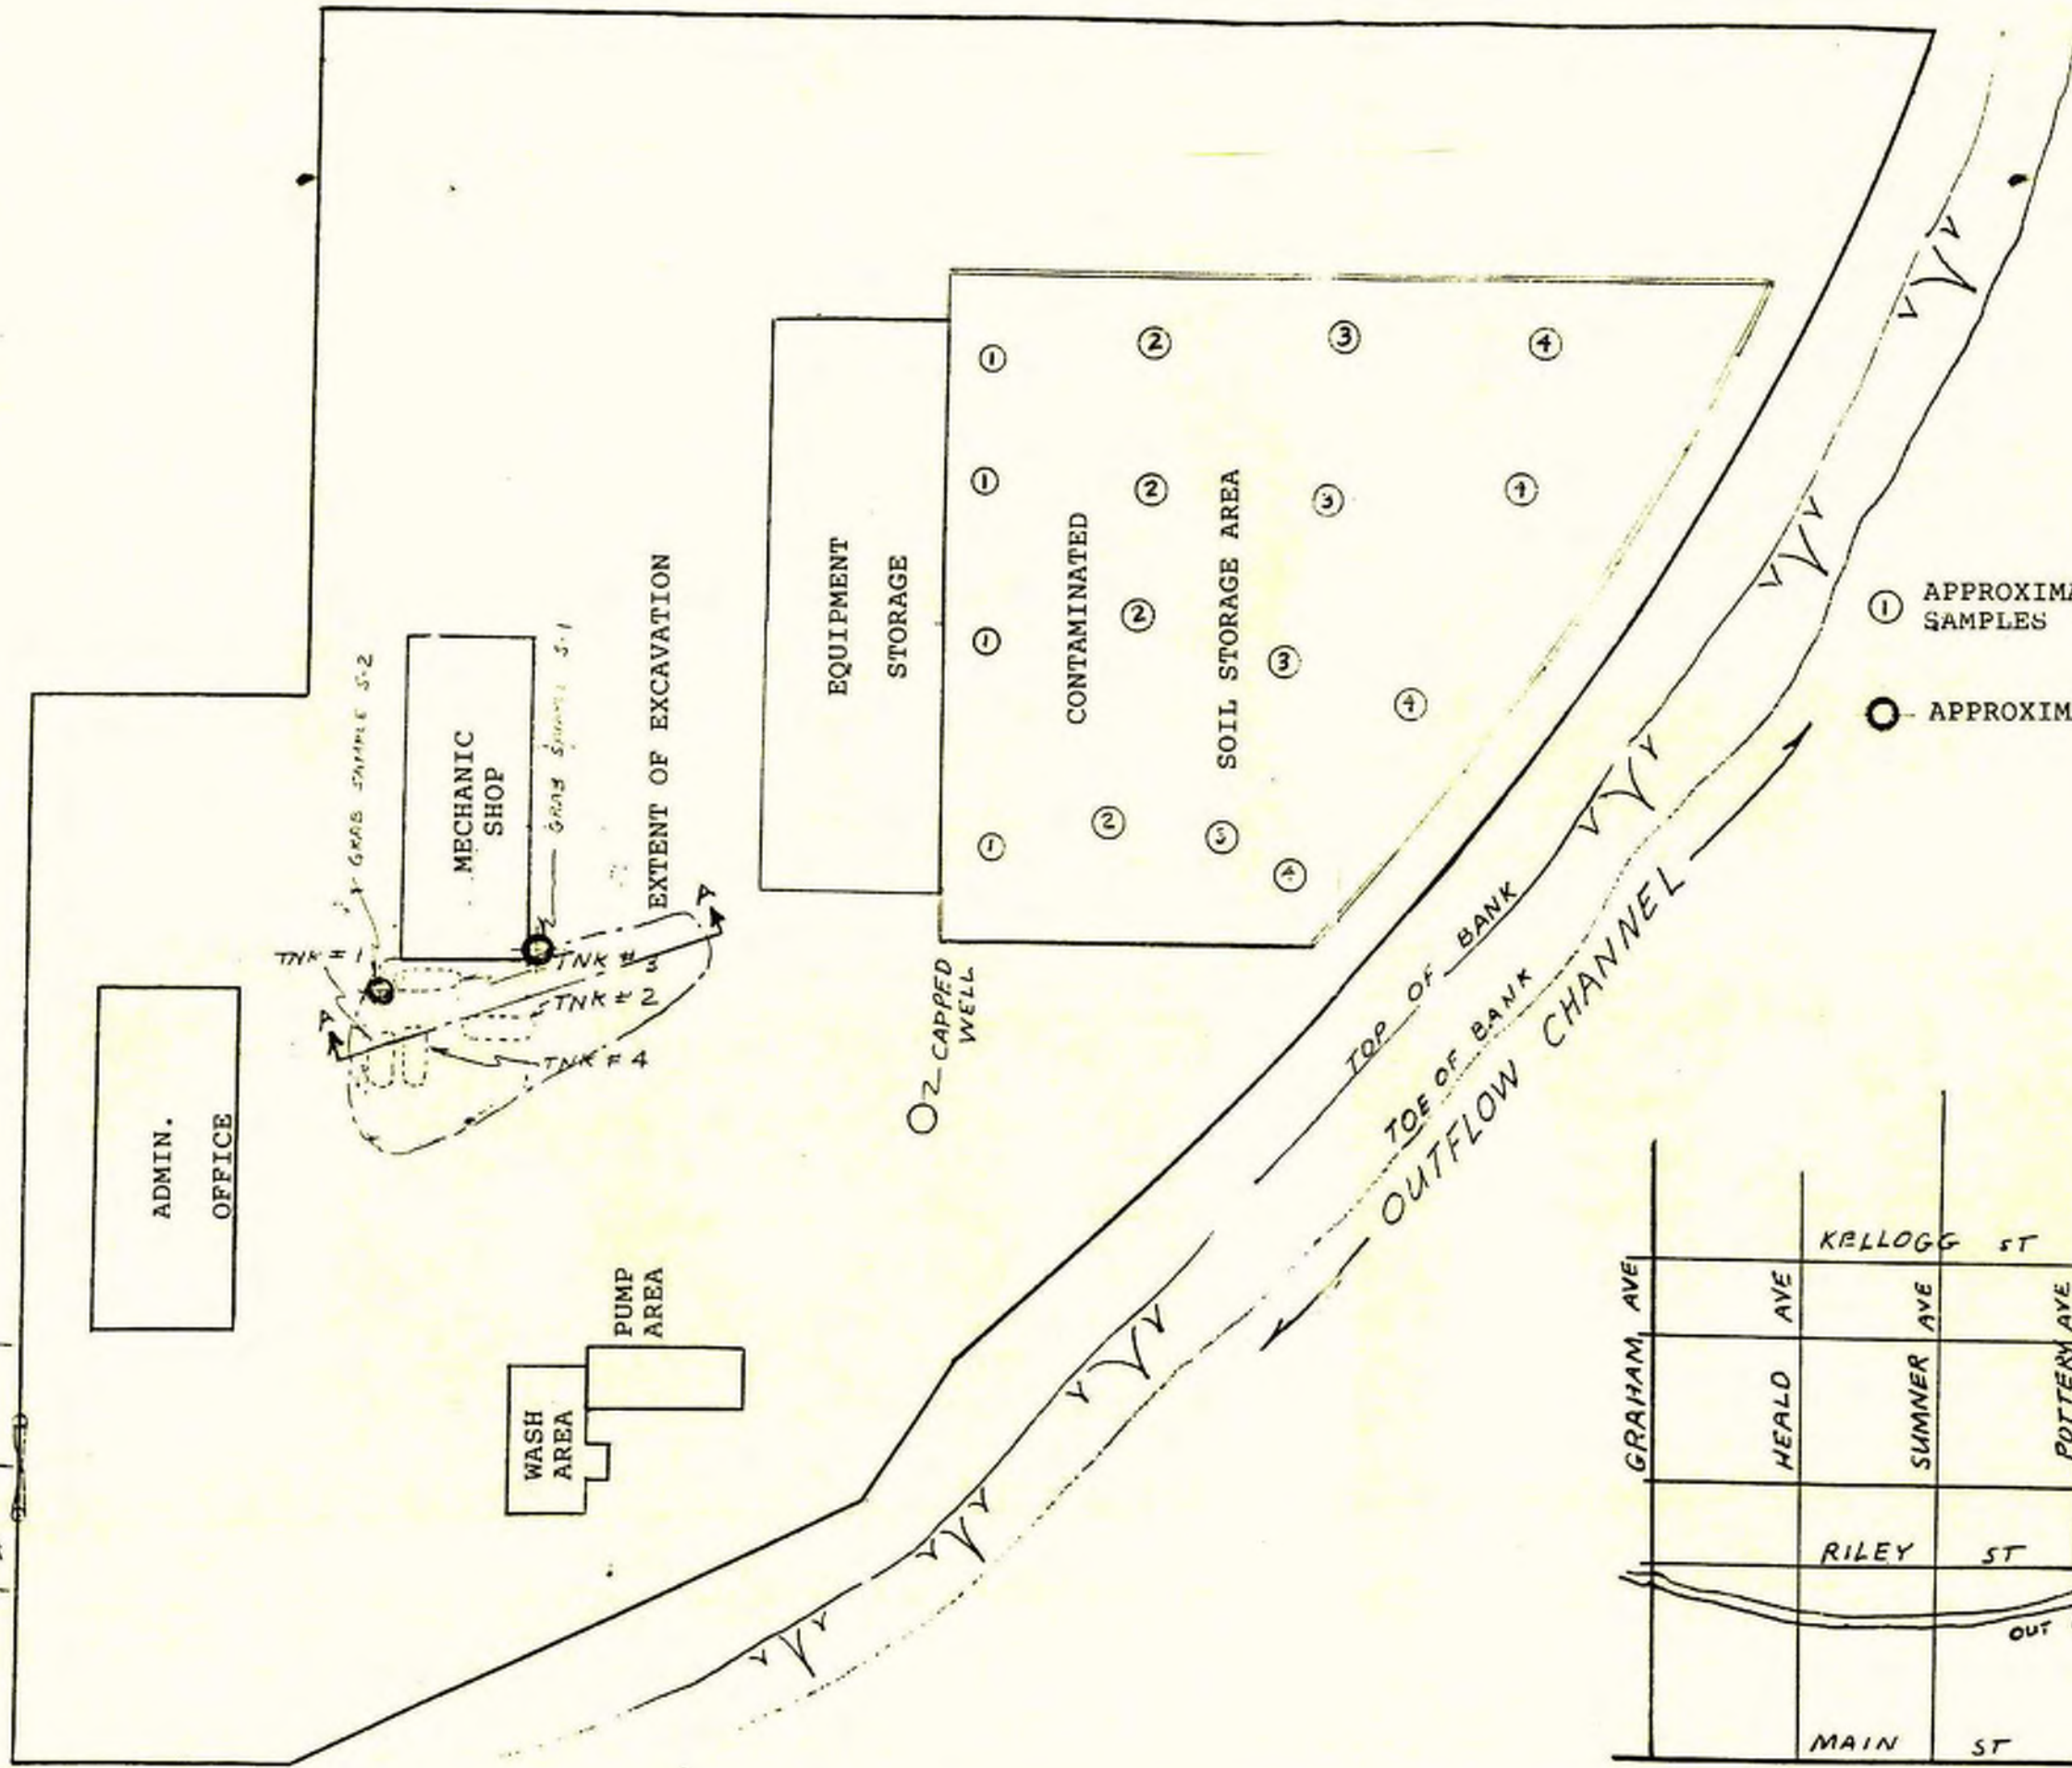

Respectfully submitted,

RE: Underground Storage Tank Cleanup Mobil #18-AAH located at 29300 Central Ave. in Lake Elsinore

Dear Mr. Puig:

This letter confirms the completion of a site investigation and corrective action for the underground storage tanks located at the above described location. Thank you for your cooperation throughout this investigation. Your willingness and promptness in responding to our inquires concerning the underground storage tanks are greatly appreciated.

Based on the information in the above-referenced file, and with the provision that the information provided to this agency was accurate and representative of site conditions, this agency finds that the site investigation and corrective action carried out at your underground storage tank site is in compliance with the requirements of subdivisions (a) and (b) of Section 25296.10 of the Health and Safety Code and with corrective action regulations adopted pursuant to Section 25299.3 of the Health and Safety Code and that no further action related to the petroleum release at the site is required.

This notice is issued pursuant to subdivision (g) of Section 25296.10 of the Health and Safety Code. If you have any questions regarding this matter, please contact Sharon Boltinghouse at (951) 955-8982.

Sincerely,

Steve Van Stockum
Director, Environmental Health

VII. Additional Comments, Data, Etc.

Site History/Release Information:

On November 29, 2001, 11 soil samples were taken beneath the dispensers and product lines for a fuel system upgrade. Up to 7.9 ppm TPH and 230 ppb MTBE was detected. The site was placed into LOP.

Assessment:

On April 2, 2002, 4 borings were drilled to 40'. Up to 740 ppb MTBE (35') was detected in the soil.

In mid-December 2002, three groundwater wells were installed. The wells were screened from 25 to 55'. Up to 1200 ppb MTBE (30') and 600 ppb TBA (40') were detected in the soil.

On Nov. 17 and 18, 2003, four additional wells were installed. The wells were screened from 23-53', 18-48', and 20-50'. Up to 16000 ppb MTBE (30 and 35') and 19000 ppb TBA (20') were detected in the soil.

3 additional wells were installed January 28 and 29, 2004. The wells were screened from 20-50' and 25-50'. Up to 3500 ppb MTBE (25') and 1900 ppb TBA (40') were detected in the soil.

One final well was installed September 2004. No oxygenates were detected in the oil except for one hit of DIPE at 0.022J at 35'.

Groundwater Monitoring:

The groundwater was sampled from January 2, 2003 until January 12, 2010. TPHg decreased from 12500 ppb to <100 ppb. Benzene decreased from 29 ppb to <0.5 ppb and has not been detected above 1 ppb since November 2005. MTBE decreased from 12000 ppb to 1.3 ppb. TBA decreased from 135000 ppb to 29 ppb.

Remediation:

Dual Phase Vacuum Extraction was operated on site using 6 wells from October 13, 2005 to June 12, 2006 running one month a quarter. The system operated 1981 hours and removed 31751 gallons of water 725 pounds of VOC's and 85 pounds of TPHg. TPHg vapor influent went from 96 ppmv to <10 ppmv. MTBE went from 37 to 0.68 ppmv.

CASE CLOSURE SUMMARY
LEAKING UNDERGROUND FUEL STORAGE TANK PROGRAM

SITE NAME: Mobil 18-AAH

SITE NO: 200118158

Verification:

Four confirmation borings were drilled to 40' on November 5, 2007 and sampled every 5'. All constituents were ND except for MTBE which had two hits of 2.3J and 2.7J ppb

The SARWQCB was concerned that there may be a TBA groundwater detached plume which had left the property. They requested additional off-site assessment in the southwest direction. 4 hydropunch borings were advanced off-site on the Chevron property July 14, 2010. One boring did not have sufficient gw recharge to allow sample collection. No TPHg or VOCs were detected in the gw from the other three borings.

Other information:

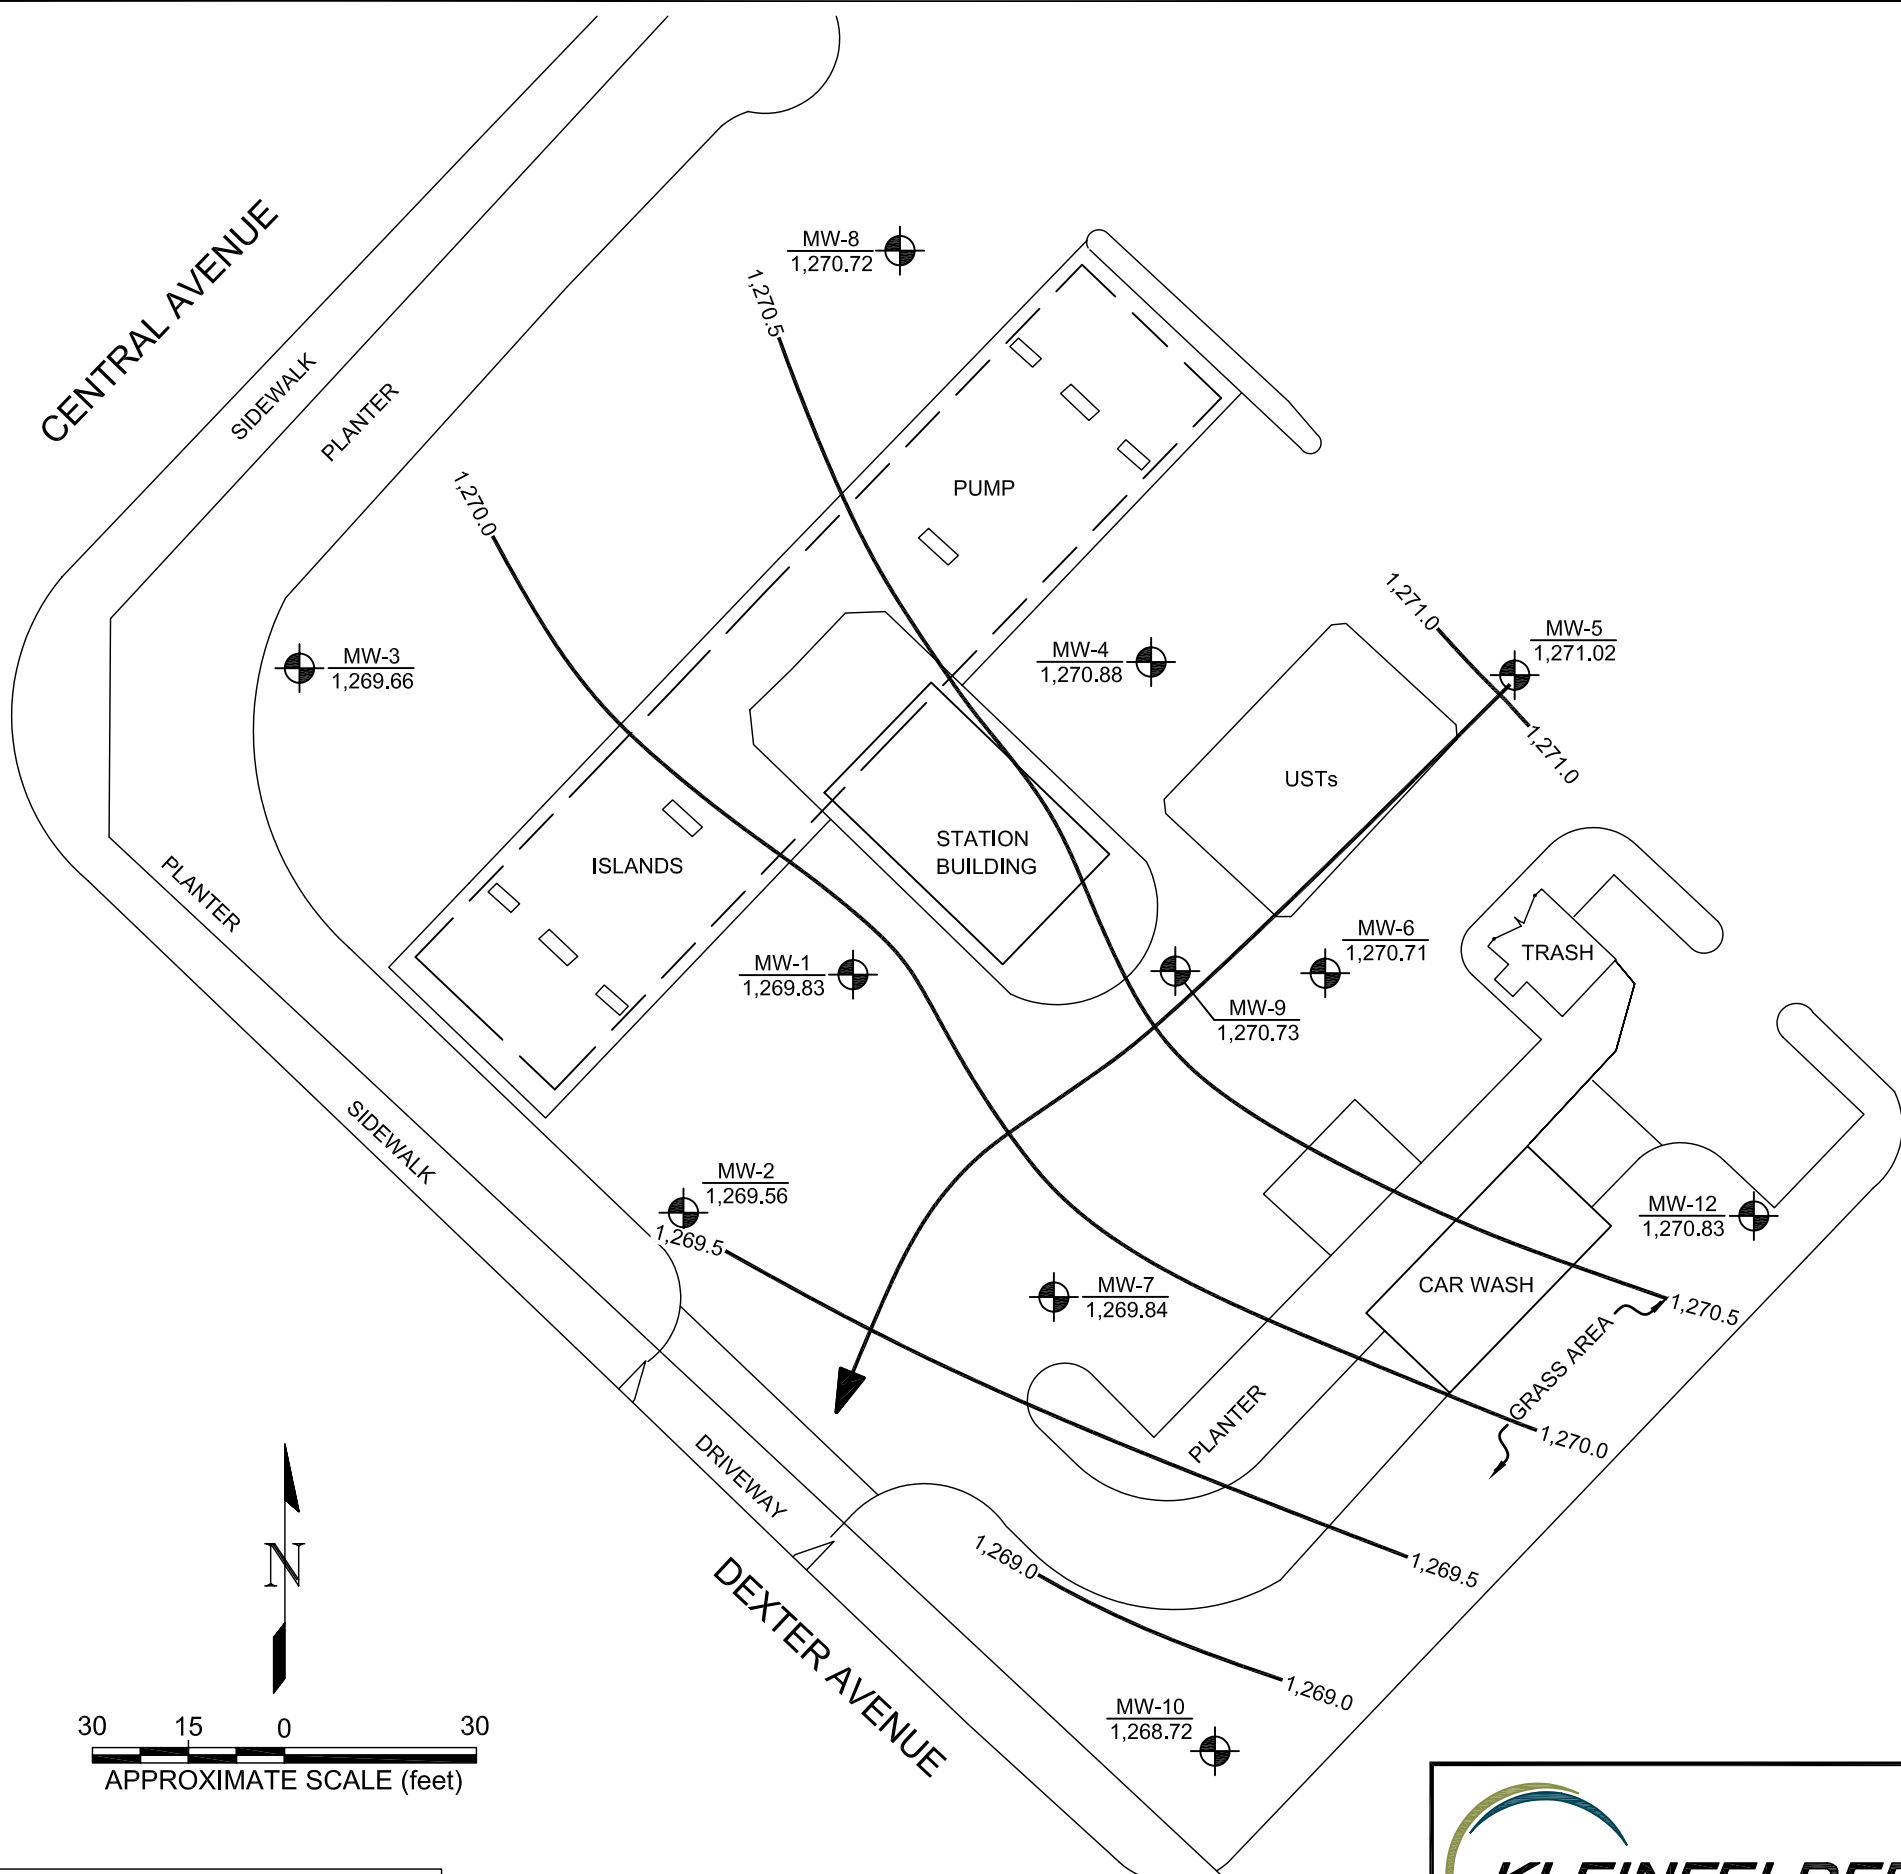

The site is currently an active gas station.

NOTE: This closure summary does not include all of the data for this cleanup. It was prepared by the Riverside County DEH for the purpose of providing a brief summary for case closure evaluation. The Closure Report (Kleinfelder, February 27, 2008) and all other environmental reports pertaining to this cleanup site as well as the RCDEH Local Oversight Program case file should be reviewed in their entirety to obtain further details regarding this cleanup.

RE: Underground Storage Tank (UST) Cleanup at ARCO Facility #5618 located at 29355 Central Avenue in Lake Elsinore, CA.

Dear Mr. Fah:

This letter confirms the completion of a site investigation and corrective action for the underground storage tank(s) located at the above described location. Thank you for your cooperation throughout this investigation. Your willingness and promptness in responding to our inquiries concerning the underground storage tank(s) are greatly appreciated.

Based on the information in the above-referenced file, and with the provision that the information provided to this agency was accurate and representative of site conditions, this agency finds that the site investigation and corrective action carried out at your underground storage tank(s) site is in compliance with the requirements of subdivisions (a) and (b) of Section 25296.10 of the Health and Safety Code and with corrective action regulations adopted pursuant to Section 25299.3 of the Health and Safety Code and that no further action related to the petroleum release(s) at the site is required.

This notice is issued pursuant to subdivision (g) of Section 25296.10 of the Health and Safety Code. If you have any questions regarding this matter, please contact Sharon Boltinghouse at (951) 955-8982.

Sincerely,

Steve Van Stockum

Title: *Chief, UST Section*

VII. Additional Comments, Data, Etc.

On November 22, 2002, soil samples were taken during dispenser and piping upgrades. MTBE was detected in 10 of 19 samples up to 0.86 ppm. The site was placed into the LOP program for further assessment.

In July 2003, three angle soil vapor extraction wells (B-1, B-2, and B-3) were installed to depths of approximately 45 feet below ground surface (bgs). TPHg and benzene were not detected in any of the soil samples analyzed. MTBE was detected in nine of the 27 soil samples with a high of 17 ppm MTBE detected at 40 ft bgs in boring B-1. Soil vapor extraction wells screened from 5 ft to 45 ft bgs were installed in the borings. Groundwater was not encountered; however, the Mobil station across the street has a water table at 41ft bgs. Bases on the results of this assessment the installation of groundwater monitoring wells were required.

In September 2003, three groundwater monitoring wells (MW-4, MW-5, and MW-6) were installed. MW-4 was installed to approximately 65 ft bgs. MW-5 and MW-6 were installed to approximately 70 ft bgs. Groundwater was encountered between 42 ft and 53 ft bgs. MW-4 was screened from 35 ft to 65 ft bgs and MW- 5 and MW-6 were screened from 40 ft to 70 ft bgs. All soil samples were ND for TPHg. Benzene was detected in two soil samples at 0.0018 ppm (MW-6@65 ft) and 0.00072 ppm (MW-6@70 ft). MTBE was detected in three samples at 0.0090 ppm (MW-4@50 ft), 0.0021 ppm (MW-4@55ft), and 0.0023 ppm (MW-6@55 feet).

In March 2007, the consultant requested closure as the leak has been stopped, the site was adequately characterized, the groundwater plume is stable, and the site presents no significant threat to the environment.

CASE CLOSURE SUMMARY

LEAKING UNDERGROUND FUEL STORAGE TANK PROGRAM

SITE NAME: ARCO 5618

SITE NO: 200319347

In April 2007, closure was denied as the well screens were submerged and the 17 ppm MTBE was not addressed. The RCDEH required groundwater sampling from all the wells (monitoring and SVE), and based on those results, soils remediation may be needed.

On July 3, 2007, six wells were sampled (three groundwater monitoring wells and three SVE wells). No TPHg, BTEX or oxygenates detected in any well. Groundwater elevations in monitoring well MW-5 were still above the screen interval. The water level ranged from 36.5 to 39.46 ft bgs, above the level where the 17 ppm MTBE was detected at 40 ft bgs in the soil. The consultant recommended the site be reviewed for closure.

In December 2007, closure was considered but denied based on 17 ppm MTBE found at 40 ft bgs in well B-1. Assessment is required in the area downgradient from the southwest dispenser. No down gradient wells have been installed in this area.

January/February 2008, Soil samples were collected during dispenser piping upgrade and pump island extension work. Station improvements include three UST's, four dispenser islands, and a convenience store. Samples were collected beneath four dispenser islands (DISP-1-3' through DISP-4-3') and six product lines (PL-1-3' through PL-6-3') using a hand auger. On February 6, 2008, composite soil samples were collected from the two stockpiles (SP-1 and SP-2) and one additional soil sample was collected from beneath product line (PL-7-3). All samples collected contain lead ranging from 3.7 ppm (DISP-1-3) to 8.6 ppm (SP-1). All samples were ND for TPHg, BTEX, MTBE, DIPE, ETBE, TAME, TBA or ethanol.

In Feb 2008, soil vapor extraction well B-3 and ground water monitoring well MW-6 were destroyed due to construction activities on the east side of the dispensers.

In April 2008, monitoring well MW-7 was installed downgradient of B-1. The purpose of the assessment was to further define the extent of dissolved hydrocarbons in groundwater downgradient from dispenser #1. The monitoring well was installed 15 ft north of purposed area due to underground utilities. The well was completed to 50 ft bgs and screened between 30 ft to 50 ft bgs. Groundwater was encountered at approximately 39- 40 ft bgs. Groundwater samples were ND for all constituents tested except 0.42J ppb toluene and 50J ppb naphthalene. Soil samples were collected every 5 feet. All soil samples were ND for all constituents tested (TPHg, BTEX, MTBE, DIPE, ETBE, TAME, TBA and Ethanol).

In January 2009, the consultant recommended site closure based on non-detect results from groundwater samples. Groundwater elevations in monitoring well MW-5 were still above the screen interval. Groundwater was within the screened zone in B-1, B-2, MW-4, and MW-7.

In May 2009, RCDEH and the SARWQCB reviewed the site for closure and were concerned about the 17 ppm MTBE detected in the submerged soil sample at 40 feet from boring B-1 near the dispenser. Additional sampling or vapor testing in this area was required to explain the concentration of MTBE detected in soil and not reflected in groundwater sampling results.

In September 2009, RCDEH and the SARWQCB concurred with case closure based on information obtained from a site visit on September 15, 2009. Groundwater monitoring well MW-7 was observed to be 10 feet from the dispenser and not 20 feet as depicted on site maps submitted in reports. Additional sampling was not required and assessment was considered complete.

Groundwater Monitoring

Groundwater monitoring and sampling activities began in November 2003. Monitoring wells B-1 and B-2 were installed on July 3, 2007 and have been ND for all constituents tested since installation (nine quarters). Monitoring wells B-3 was also installed on July 3, 2007, and ND for all constituents tested for three quarters until it was destroyed

CASE CLOSURE SUMMARY LEAKING UNDERGROUND FUEL STORAGE TANK PROGRAM

SITE NAME: ARCO 5618

SITE NO: 200319347

on February 1, 2008 due to construction activities. Monitoring wells MW-4 and MW-5 were installed on November 5, 2003. Groundwater monitoring well MW-4 has been ND for all constituents tested except for MTBE which was detected at a maximum concentration of 75 ppb in August 2005. MW-4 has been ND for all constituents test, including MTBE, for the last nine quarters. MW-4 had a submerged screen between March 2005 and October 2006. Groundwater monitoring well MW-5 has had a submerged screen since December 2004 and has been ND for all constituents tested since installation. Groundwater monitoring well MW-6 was installed on November 5, 2003 and destroyed on February 1, 2008 due to construction activities. MW-6 was ND for all constituents tested except for a maximum concentration of MTBE at 56 ppb in August 2004 and 1.8J ppb methyl chloride. MW-6 had a submerged screen between May 2005 and January 2007. Groundwater monitoring well MW-7 was installed in April 2008, and has been ND for all constituents tested except 0.42J ppb Toluene.

A final groundwater sampling event was conducted on July 1, 2009. All five wells were sampled and ND for all constituents tested except: bromodichloromethane at 0.46J ppb (MW-7) and 0.35J ppb (B-1); chloroform at 0.49 ppb (MW-7) and 0.48 ppb (B-1); and dibromochloromethane at 0.57J ppb (MW-7) and 0.49 ppb (B-1).

Subsurface Soil types: Silty sand and gravelly sand to a depth of approximately 15 ft bgs. Clayey silt, sandy clay, clayey sand, and silty sand were observed from approximately 15 to 25 ft bgs. Interbedded layers of silty sand, gravelly sand, and sandy silt were observed below 25 ft bgs to approximately 70 ft bgs, the total depth of investigation.

Historical Depth To GW: 29.53 ft bgs to 41.36 ft bgs **Current Depth:** 36.24 ft bgs to 38.56 ft bgs

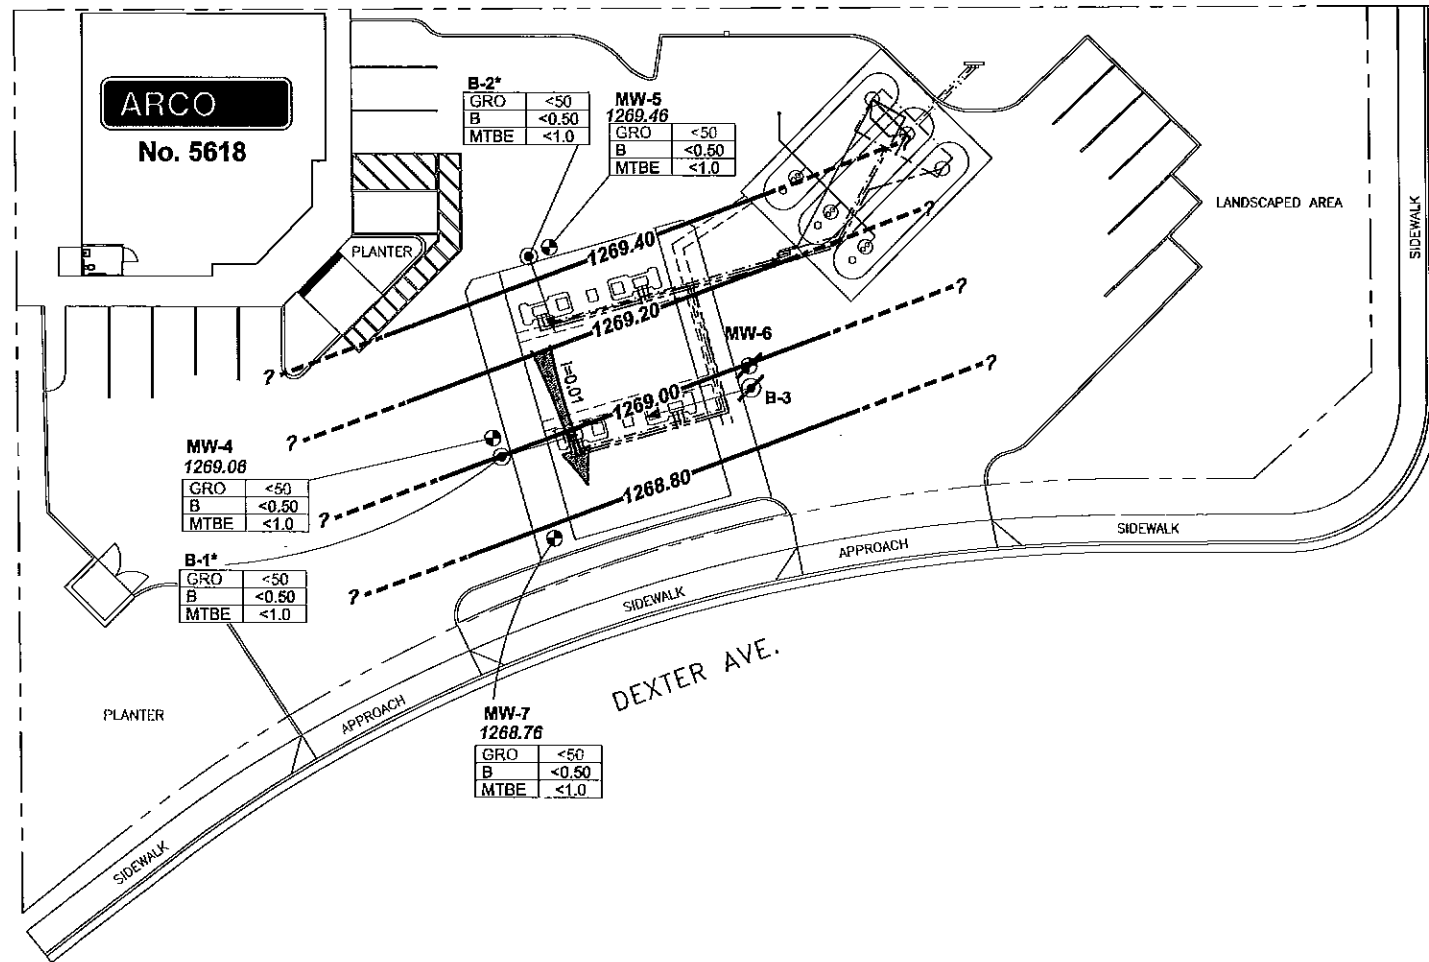

GW Flow: South-southwest (previously south)

Remediation: All initial concentrations remain in-situ. No remediation has taken place.

Sensitive Receptors: The nearest water well is located approximately 3100 feet southwest of the site. Surface water in the vicinity of the site includes two unnamed creeks; one located approximately 1,500 feet to the southeast and the other approximately 1,500 northeast of the site. Additionally, Lake Elsinore is approximately 8,000 feet to the southeast of the site.

Other information: UST system currently installed and operating at the site.

NOTE: This closure summary does not include all of the data for this cleanup. It was prepared by the Riverside County DEH for the purpose of providing a brief summary for case closure evaluation. The Request for Closure (Stantec, January 16, 2009) and all other environmental reports pertaining to this cleanup site as well as the DEH Local Oversight Program case file should be reviewed in their entirety to obtain further details regarding this cleanup.

RE: Underground Storage Tank Cleanup at Pacific Clay (UST #1) at 14741 Lake Street, Lake Elsinore

Dear Responsible Parties,

This letter confirms the completion of site investigation for the underground storage tank formerly located at the above described location. Thank you for your cooperation throughout this investigation. Your willingness and promptness in responding to our inquires concerning the former underground storage tank are greatly appreciated.

Based on the information in the above referenced file, and with the provision that the information provided to this agency was accurate and representative of site conditions, this agency finds that the site investigation carried out at your underground storage tank site is in compliance with the requirements of subdivision (a) and (b) of Section 25299.37 of the Health and Safety Code and that no further action related to the petroleum release at the site is required.

This notice is issued pursuant to subdivision (h) of Section 25299.37 of the Health and Safety Code. Please contact our office if you have any questions regarding this matter.

Sincerely,

Earl E. Tuntland
Assistant Environmental Health Administrator

CASE CLOSURE SUMMARY
LEAKING UNDERGROUND FUEL STORAGE TANK PROGRAM

SITE NAME: Pacific Clay Products, Inc. (UST #1)

SITE NO: 980955

V. Local Agency Representative Data

NAME: Ead Tuntand	TITLE: Asst. Environmental Health Administrator
SIGNATURE: <i>[Signature]</i>	DATE: 9/6/00

VI. RWQCB Notification

DATE SUBMITTED TO RWQCB:	RWQCB RESPONSE: <i>[Signature]</i>
RWQCB STAFF NAME: <i>[Signature]</i>	TITLE: Senior Eng. Geologist
SIGNATURE: <i>[Signature]</i>	DATE: 8/8/2000

VII. Additional Comments, Data, Etc.

On July 15, 1998, one 10,000 gallon gasoline tank was removed from the site. Soil samples taken beneath the tank showed 21 ppm TPHg, no benzene or MTBE and low levels of toluene, ethylbenzenes, and total xylenes. The site was placed into LOP as the water table was 7' bgs.

On September 29 and 30, 1998, 159 tons of soil were excavated from the site to 15' bgs. Soil confirmation results showed no TPHg, benzene, ethylbenzene, or MTBE. Only slight hits of toluene at 0.011 ppm and xylenes at 0.006 ppm were left.

The LOP staff asked for a groundwater monitoring well due to the shallow (7' bgs) groundwater, the presence of 12 wells within one mile of the site and the location of the site in a wash. On August 10, 1999, a well was installed. The groundwater has been sampled for a total of 4 quarterly sampling events and has been ND for all four events for TPHg, MTBE, and BTEX. The well was also sampled during one event for EtBE, DIPE, TAME, and TBA and no oxygenate was detected.

The consultant is requesting no further action as the results from the four groundwater monitoring events do not indicate a presence of petroleum fuel hydrocarbons or related constituents.

RE: Underground Storage Tank Cleanup at Pacific Clay (UST #2) at 14741 Lake St., Lake Elsinore.

Dear Responsible Parties:

This letter confirms the completion of site investigation and remedial action for the underground storage tank(s) formerly located at the above described location. Thank you for your cooperation throughout this investigation. Your willingness and promptness in responding to our inquires concerning the former underground storage tank(s) are greatly appreciated.

Based on the information in the above-referenced file, and with the provision that the information provided to this agency was accurate and representative of site conditions, no further action related to the underground tank release is required.

This notice is issued pursuant to a regulation contained in Section 2721(e) of Title 23 of the California Code of Regulations.

If you have any questions regarding this matter, please contact Dori Malloy at (909) 358-5055.

Sincerely,

Earl E. Tuntland
Assistant Environmental Health Administrator

VII. Additional Comments, Data, Etc.

One 10,000 gallon diesel tank was removed (western portion of the property near the vehicle maintenance shop) on July 15, 1998. The tank was situated in a very shallow excavation, due to bedrock at approximately 9' bgs. The samples collected at the time of the tank removal indicated that there had been a release (5,300 ppm TPH-d, no Benzene, no MTBE, trace TEX). A remedial excavation took place during September 29-30, 1998. The clayey sand soil on the side walls, which indicated possible contamination, was removed. A total of approximately 58 tons of contaminated soil was excavated from the former UST location. The confirmation samples collected along the side walls after the excavation indicated that TPH-diesel, BTEX, and MTBE were not detected above the reporting limits. The bedrock base of the excavation could not be sampled. Groundwater was not encountered. The consultant is requesting no further action based on the facts that the source has been removed. Benzene and MTBE were not detected at this location, and groundwater was not encountered.

Note: There are two wells on site approximately 500 feet north-northwest of the UST location, but they have not been used for at least the previous 5 years. They are too rankish to be used as drinking water, but they are considered water supply wells.

VII. Additional Comments, Data, Etc.

One 10,000 gallon diesel tank was removed on July 15, 1998 (eastern portion of the site). At the time of the tank removal diesel contamination was detected in only one sample, collected four feet below the bottom of the tank at 16' bgs (660 ppm). Neither BTEX nor MTBE were detected. The site was put into the program for further investigation because the diesel contamination was not delineated. Subsequent remedial excavation activities were conducted from September 29, 1998 through September 30, 1998. The soils excavated were silty sands. There was diesel impacted soil identified in the eastern and southeastern corner of the excavation (maximum 1,800 ppm TPH-diesel at 12' bgs) which extended to a depth of approximately 17' bgs. The excavation was then extended to the south and to the east to a total depth of 21' bgs, where most soils were encountered. It should be noted that neither Benzene nor MTBE were detected at concentrations above the reporting limits in any of the soil samples from the Area 3 excavation. A total of approximately 55 tons of soil were excavated and transported offsite for treatment and recycling. The consultant is requesting no further action based on the facts that the source has been removed and that neither Benzene nor MTBE were ever detected at the site.

Note: There are two wells on site approximately 500 feet north-northwest of the UST location, but they have not been used for at least the previous 5 years. They are too rankish to be used as drinking water, but they are considered water supply wells.

RE: Underground Storage Tank Cleanup at Sunwest Materials located at 24980 Maitri Road in Corona.

Dear Responsible Party:

This letter confirms the completion of site investigation and remedial action for the underground storage tank(s) [formerly] located at the above described location. Thank you for your cooperation throughout this investigation. Your willingness and promptness in responding to our inquires concerning the [former] underground storage tank(s) are greatly appreciated.

Based on the information in the above-referenced file, and with the provision that the information provided to this agency was accurate and representative of site conditions, this agency finds that the site investigation and corrective action carried out at your underground storage tank(s) site is in compliance with the requirements of subdivisions (a) and (b) of Section 25299.37 of the Health and Safety Code and with corrective action regulations adopted pursuant to Section 25299.77 of the Health and Safety Code and that no further action related to the petroleum release(s) at the site is required.

This notice is issued pursuant to subdivision (h) of Section 25299.37 of the Health and Safety Code. If you have any questions regarding this matter, please contact Kelly Winters at (909) 358-5055.

Sincerely,

Gary Root

VII. Additional Comments, Data, Etc.

10/14/99 One 10,000 gallon diesel UST was removed from the subject site. Soil samples collected at the time of removal indicated the presence of diesel contamination in soil to a depth of 17' below ground surface. Diesel contaminated soil was observed by the consultant at the west end of the tank excavation area. The highest diesel concentrations detected in soil at this time were from a sample collected at 6' below ground surface:

Sample D1-6'

TPH-D- 8750ppm
Benzene – ND
T- ND
EB- 0.146ppm
Xylenes – 0.385ppm
MTBE – ND

December 1999 through January 2000

Remedial Excavation and soil sampling continued at the site. A total of 874 cubic yard of soil was excavated and segregated on-site. Soil that was determined to be "highly contaminated" was taken to Alternative Disposal in Glen Helen California for disposal. The soil sample that contained the highest diesel concentration was stockpile sample C-4C - 16,000ppm. Soil that was determined to contain "low levels" of contamination was utilized as material for making concrete at the Sunwest Concrete Plant in Corona.

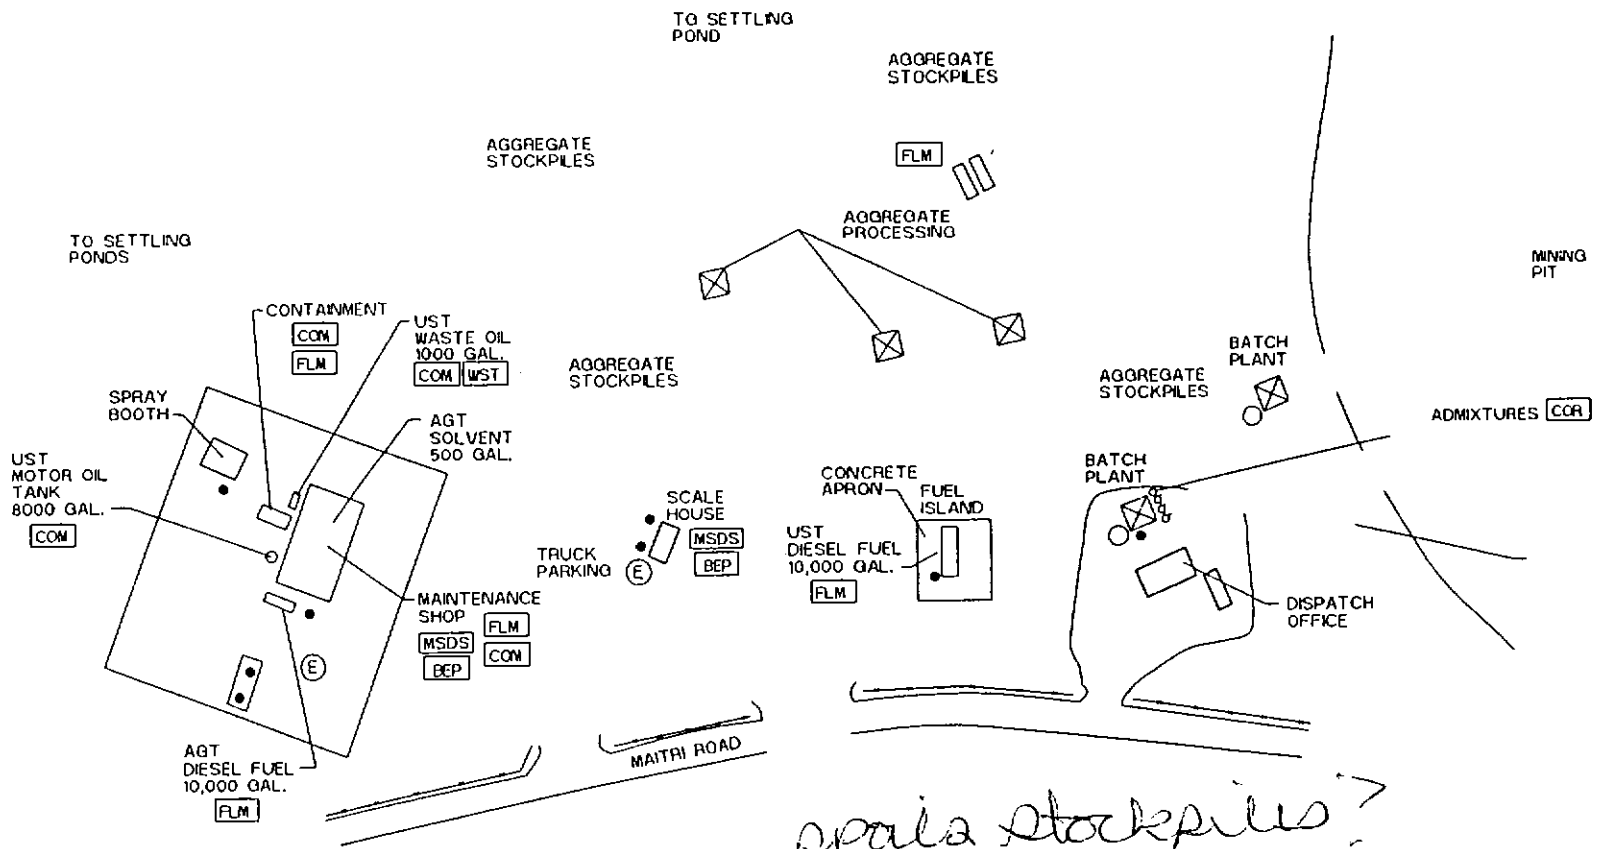

Confirmation samples were collected under the supervision of a Riverside County Specialist at various depths to 30 feet bgs. Groundwater was not encountered during remedial excavation activities. Confirmation sampling indicated decreasing hydrocarbon concentration trends to the total depth excavated. Of the six final confirmation samples collected on January 21, 2000, two (CS-1 and CS-3) contained detectable concentrations 21ppm and 96ppm TPH-D respectively.

The consultant and the responsible party are requesting closure based on source removal and the low levels (less than 100ppm diesel) left in place.

Corona, Ca. 91718

Dear Responsible Party:

UNDERGROUND STORAGE TANK (UST) CASE
Mission Clay Products located at 23835 Temescal Canyon Rd. in Corona.
#93-929

This letter confirms the completion of site investigation and remedial action for the underground storage tank(s) formerly located at the above-described location.

Based upon the available information, including the current land use, and with the provision that the information provided to this agency was accurate and representative of site conditions, no further action related to the underground storage tank release is required.

This notice is issued pursuant to a regulation contained in Title 23, California Code of Regulations, Division 3, Chapter 16, Section 2721 (e). If the property owner proposes to change the land use so as to require approval by the local planning agency, the owner should promptly notify this agency.

Please telephone Dori Malloy at (909) 358-5055 if you have any questions regarding this matter.

Sincerely,

Earl E. Tuntland

COMMENTS (soil types, depth of remediation, etc.): The contaminated soil was removed from the excavation and stockpiled on site. The excavation has been shown to be clean with confirmation samples, but the stockpile still has some elevated concentrations present. The consultant has proposed spreading the contaminated soil out on site.

VII. Additional Comments, Data, Etc.

On October 4, 1993 three tanks (2 diesel, 1 gas) were removed and soil samples collected. Contamination was found beneath one tank (4,400 ppm diesel) and on the side wall (25,300 ppm diesel). In November and December of 1993 approximately 1,800 yards of contaminated soil was excavated and stockpiled elsewhere on site. In March 1995 five additional borings were drilled in the excavation to complete the delineation process. All of the results were ND. Confirmation samples were then collected in July 1995 [at the bottom of the excavation (23' bgs) and along the excavation walls (17' bgs)]. All of the confirmation sampling results were ND. The stockpile was then sampled for remedial purposes. Thirty-six samples were collected from the stockpile and no BTEX was detected in any of the samples. The sample results ranged from ND to 13,600 ppm diesel. The majority of samples were under 1,000 ppm TPH-d. The consultant prepared a LUFT Manual Leaching Potential Analysis for the site and determined that an acceptable limit of 10,000 ppm TPH-d was acceptable. All but one of the samples were well below the 10,000 ppm level. The consultant has proposed spreading the stockpiled soil on site.

** NO RESPONSE FROM REGIONAL BOARD WITHIN 30 DAYS. CASE CLOSED IN ACCORDANCE WITH CONTRACT (AS PER SANDY BUNCHEK).*

RE: Underground Storage Tank Clean-up at the Arco Station located at 23760 Temescal Canyon Road in Corona, CA

Dear Mr. Bahu:

This letter confirms the completion of a site investigation and corrective action for the underground storage tanks located at the above described location. Thank you for your cooperation throughout this investigation. Your willingness and promptness in responding to our inquires concerning the underground storage tanks are greatly appreciated.

Based on the information in the above-referenced file, and with the provision that the information provided to this agency was accurate and representative of site conditions, this agency finds that the site investigation and corrective action carried out at your underground storage tank(s) site is in compliance with the requirements of subdivisions (a) and (b) of Section 25296.10 of the Health and Safety Code and with corrective action regulations adopted pursuant to Section 25299.3 of the Health and Safety Code and that no further action related to the petroleum release(s) at the site is required.

This notice is issued pursuant to subdivision (g) of Section 25296.10 of the Health and Safety Code. If you have any questions regarding this matter, please contact Sharon Boltinghouse at (951) 358-5055.

Sincerely,

Gary Root

VII. Additional Comments, Data, Etc.

Aug 1998 - Petroleum-related contamination was discovered during piping/dispenser upgrades. Concentrations up to 217 ppm MTBE were detected under two of the dispenser islands. Impacted areas were over excavated to a max depth of 14½ ft. bgs. Impacted soil remained below dispenser D9/10.

1999 - 2001 - Assessment activities consisting of the installation of 10 groundwater monitoring wells & drilling of 12 soil borings were conducted. GW was encountered at ~25-35 ft bgs and found to be impacted primarily with MTBE.

2002 - A 44-hour High Vacuum Dual Phase Extraction (HVDPE) test was conducted. Approximately 69.5 lb. TPHg was removed during the test.

2003 - Three 12,000-gal gasoline USTs and one 5,000-gal diesel UST were removed and replaced. Soil samples collected under the USTs and dispenser/piping areas were non-detect for all constituents tested.

2004 - Further HVDPE operations were conducted for 31 days. Approximately 182.83 lbs. TPHg, 0.57 lb B, 6.19 lb MTBE were removed from the vapor phase and a total of 16,000 gal of groundwater was extracted & recycled off-site.

2005 - Four confirmation soil borings were drilled to groundwater. All results were non-detect for all constituents tested.

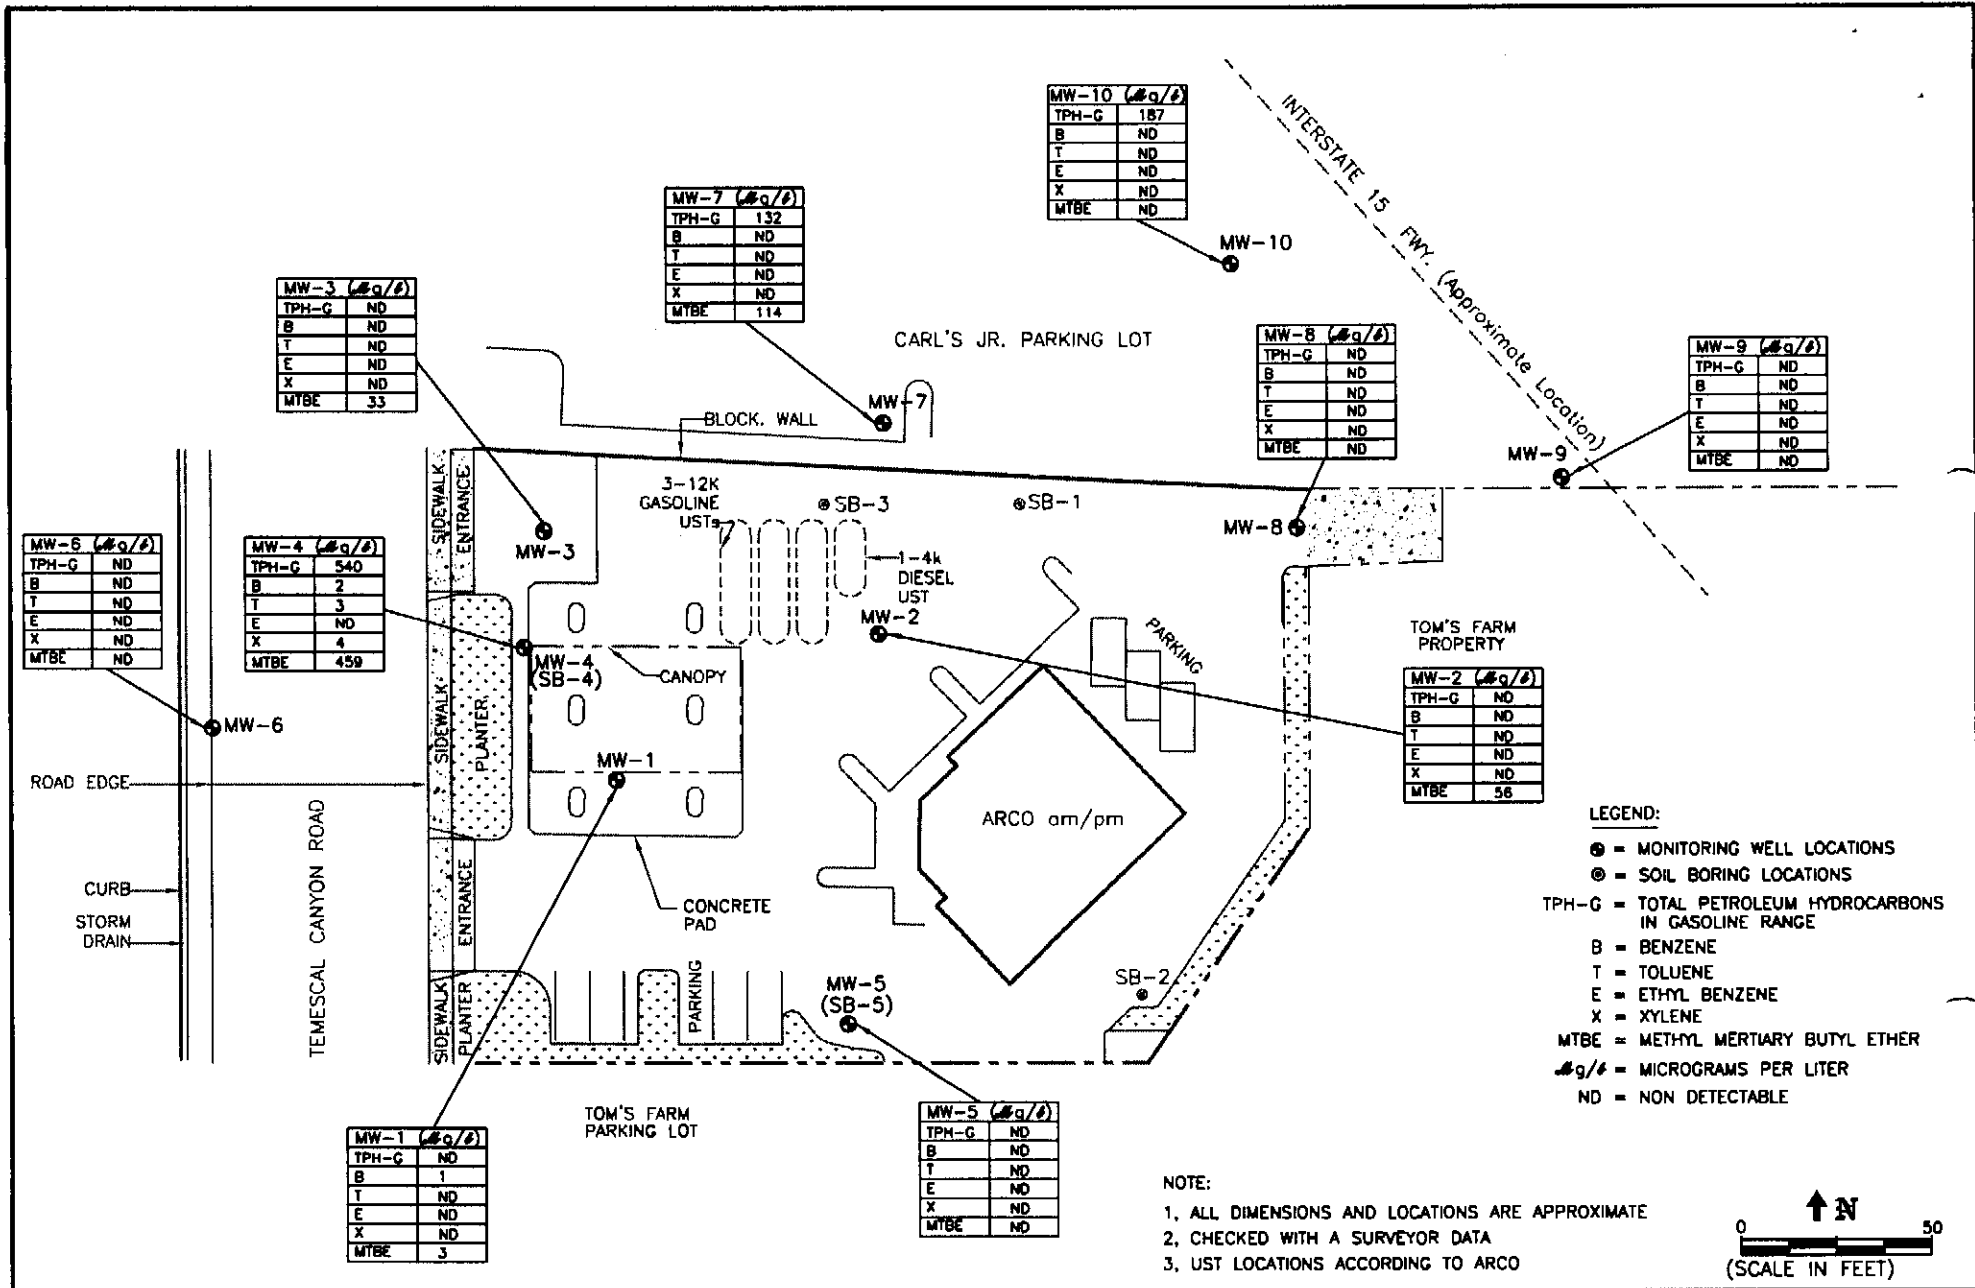

The groundwater has been monitored quarterly since 2000. For the past year, all groundwater samples have been non-detect for all constituents tested except MTBE. The most recent sampling event detected a maximum concentration of 33.3 ppb MTBE in MW-7. Depth to groundwater has ranged from 24 to 27 ft bgs with a flow toward the northeast.

Sensitive Receptors: No wells were identified within ¼ mile of the site. The Temescal Wash is ¼ mile from the site.

Soil types: Poorly sorted sand, silty sand, silt, + silt to clayed gravels.

Current land use: gas station surrounded by retail shops + restaurants

NOTE: This closure summary does not include all of the data for this cleanup. It was prepared by the Riverside County HMMD for the purpose of providing a brief summary for case closure evaluation. The Site Closure Request Document (EAR, March 1, 2006) and all previous assessment and monitoring reports as well as the HMMD Local Oversight Program case file should be reviewed to obtain additional details regarding this cleanup.

8 CONCLUSIONS

Kleinfelder has performed a Phase I ESA in general conformance with the scope and limitations of ASTM Practice E 1527-00 for the property located north-northwest of the corner of Temescal Canyon Road and Lawson Drive in Corona, California, 92883. Any exceptions to, or deletions from, this practice are described in Section 10 of this report.

This assessment has revealed no evidence of recognized environmental conditions, as defined by the ASTM Practice E 1527-00, in connection with the property. Furthermore, there are no apparent environmental concerns relative to regulations and DTSC guidance with regards to the subject Site.

RE: Underground Storage Tank Cleanup at CSR Hydro Conduit located at 23200 Temescal Canyon Rd. in Corona, CA.

Dear Responsible Party :

This letter confirms the completion of site investigation and remedial action for the underground storage tank(s) formerly located at the above described location. Thank you for your cooperation throughout this investigation. Your willingness and promptness in responding to our inquires concerning the former underground storage tank(s) are greatly appreciated.

Based on the information in the above-referenced file, and with the provision that the information provided to this agency was accurate and representative of site conditions, this agency finds that the site investigation and corrective action carried out at your underground storage tank(s) site is in compliance with the requirements of subdivisions (a) and (b) of Section 25299.37 of the Health and Safety Code and with corrective action regulations adopted pursuant to Section 25299.77 of the Health and Safety Code and that no further action related to the petroleum release(s) at the site is required.

This notice is issued pursuant to subdivision (h) of Section 25299.37 of the Health and Safety Code. If you have any questions regarding this matter, please contact Sharon Boltinghouse at (909) 358-5055.

Sincerely,

Earl E. Tuntland

RWQCB RESPONSE: 

VII. Additional Comments, Data, Etc.

9/23/00 Two (1 gasoline, 1 diesel) 9000 gallon steel underground storage tanks (UST's) removed from the subject site. TPH-G, TPH-D and BTEX were detected in soil samples collected from the former UST cavity.

5/23/00 Tank cavity area over-excavated. 610 tons of soil was excavated and taken to an appropriate disposal area. Excavation enlarged to 15 feet east of the former tank area. Excavation to the north limited by concrete slab. Former tank area excavated to a depth of 26 feet bgs.

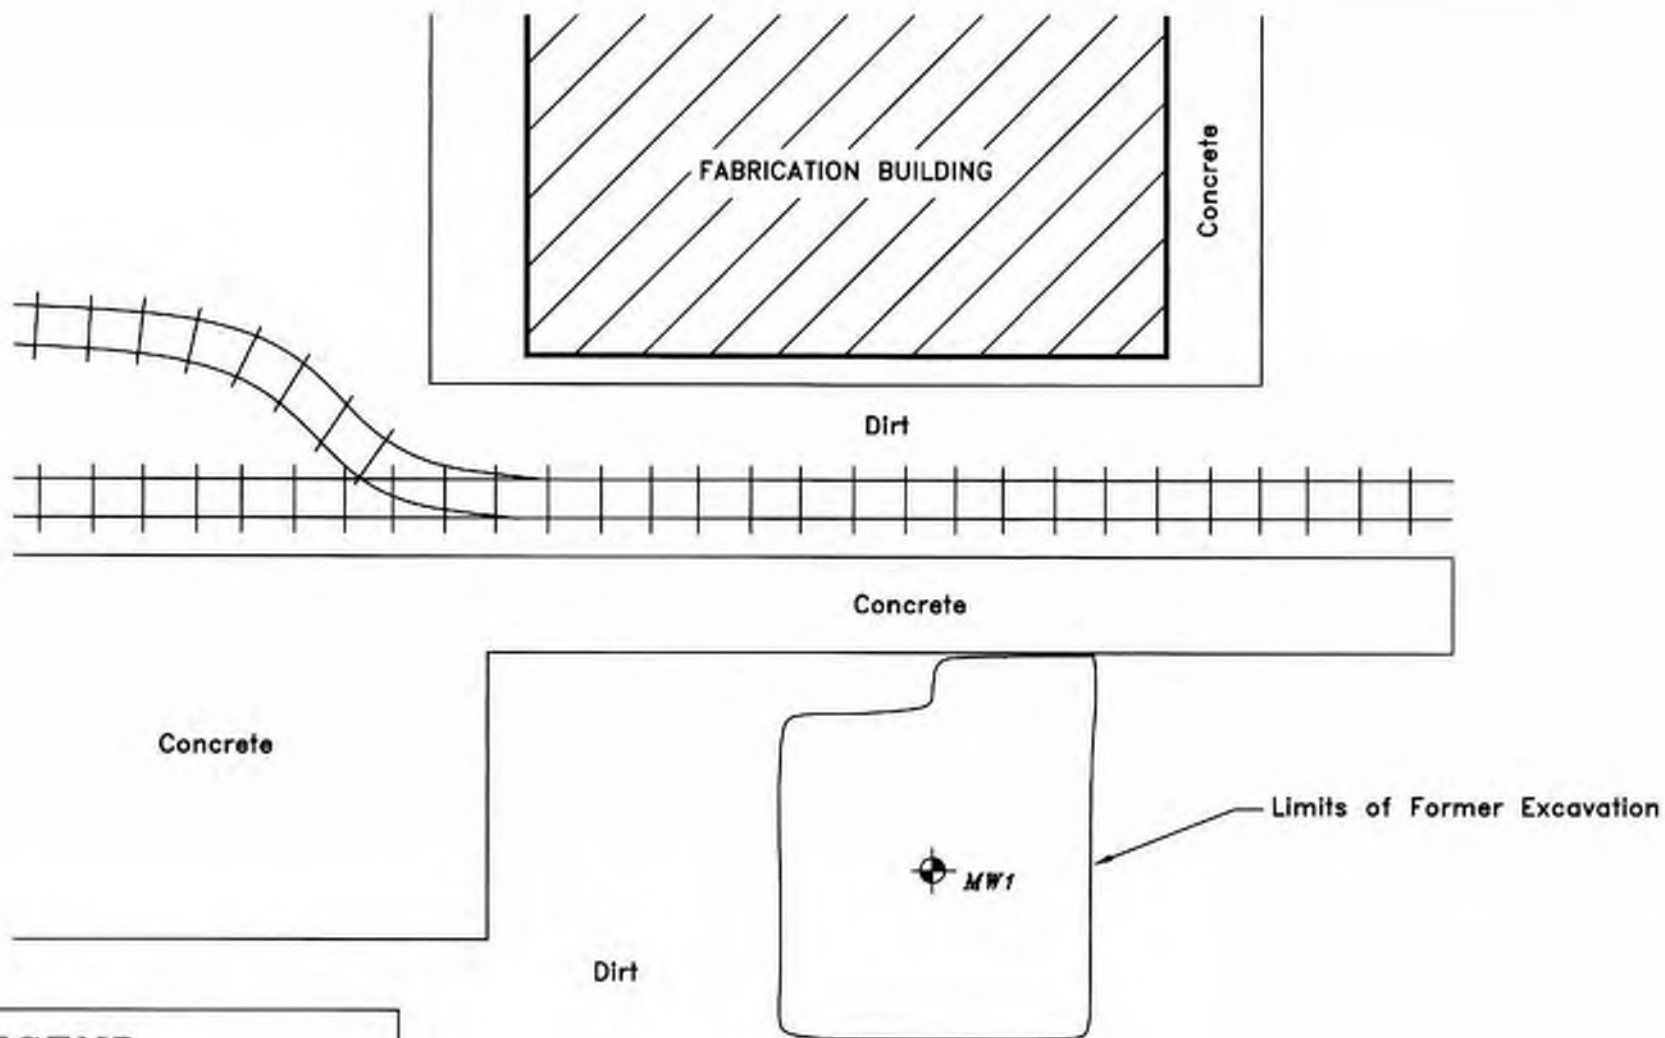

7/28,29/00 Six borings and one groundwater monitoring well installation completed. Groundwater encountered at approximately 40 feet bgs. All samples collected during soil boring and groundwater installation activities were non-detected for TPH-G, TPH-D, BTEX, MTBE and other Oxygenates. Groundwater sample collected from well was also ND for TPH-G, TPH-D, BTEX, MTBE and other oxygenates.

5/21/01 With the exception of trace contaminants encountered during Third Quarter 2000 sampling event (see attached Table 4) groundwater samples collected from MW-1 were ND for TPH-G, TPH-D, BTEX, MTBE and other oxygenates.

6/1/01 PMMD required groundwater well search for subject vicinity. According to information provided by the consultant, one active agricultural well is located on the northern property. A copy of the well search letter is attached.

Groundwater at the site has been monitored since July of 2000 to the present. The gradient at the site is unknown. The area of contamination has been excavated to a depth of 26 feet below ground surface. 610 tons of soil has been removed. The closest water well is located along the northern property boundary and is designated for agricultural use.

Trace contaminants were detected in groundwater samples collected from MW-1 during 3rd Quarter 2000. All other samples prior to and after 3rd Quarter 2000 have been non-detected.

RB CASE NO. 083302058T**

Dear Mr. Castles:

On April 27, 2004, we sent a notification of site closure proposal and a copy of the draft *Site Closure Summary* to you and to other interested parties. No comments were received during the 30-day review period. Therefore, no further action is required for this site and a copy of the final *Case Closure Summary* is attached.

Once the monitoring wells are abandoned, a report regarding the well abandonment activities must be submitted to this office.

This notice is issued pursuant to a regulation contained in Title 23, California Code of Regulations, Division 3, Chapter 16, Section 2721(e).

If you should have any questions, please contact Kenneth R. Williams or Nancy Olson-Martin at (909) 782-4496 or 4497, respectively.

Sincerely,

Gerard J. Thibeault
Executive Officer

TREATMENT AND DISPOSAL OF AFFECTED MATERIAL

MATERIAL	AMOUNT	ACTION TREATMENT OR DISPOSAL W/DESTINATION	DATE
TANKS/ PIPING	One former AST located at the intersection of Clay Canyon Drive and Brown Canyon Channel (Tract 22340)	Tank was relocated and used as a water tank during the mid-1960.	Mid-1960 (actual date unknown)
	Two former ASTs (Tract 24756)	Removed – destination unknown	May 1990
	One concrete tank (17' x 14') & 500 gallons of waste oils and water (Tract 22335)	The concrete tank was demolished and the concrete chunks were used as fill material at the site.	August 13, 1990

III. TREATMENT AND SITE CHARACTERIZATION INFORMATION – continued:

MATERIAL	AMOUNT	ACTION TREATMENT OR DISPOSAL W/DESTINATION	DATE
SOIL	10,200 Cubic Yards	Diesel-impacted soil was excavated during grading activities from the southern portion of Tract 22336. Excavation activities and confirmation soil sampling were conducted under the direction of the County of Riverside Department of Environmental Health (CRDEH). The excavated soil was deposited in two stockpiles at the northern portion of Tract 24756. From 1994 through 1998, two consulting firms conducted three separate sampling investigations of the stockpiles for classification purposes. CRDEH approved the use of the soil as road base and the area was subsequently paved.	June 1990 – July 1997
FREE PRODUCT RECOVERED GROUND-WATER	1,479.6 Gallons	A free product recovery program was implemented for wells MW-1 and MW-8. The system included a LNAPL automatic recovery pump installed in the wells. Bioremediation was implemented to further remediate the impacted vadose zone. The remediation system included a small air compressor that operated the down-well pneumatic product removal pumps installed in two wells. The equipment also included a product holding tank and a 100-cfm positive displacement blower for bioventing. Subsequently, Soakeze® oil absorbents were used in wells MW-1 and MW-8.	March 1, 1996 to present October 17, 1999 to present

N/A = Not Analyzed

¹In August 1990, soil samples were collected during the removal of the partially buried concrete diesel tank in Tract 22335.

²Between 1989 and 1990, approximately 10,000 cubic yards of diesel-contaminated soils were excavated from the southern portion of Tract 22336 and from the vicinity of a former diesel storage tank located ~350 feet northwest of Tract 24756. The soils were stockpiled and deposited on the northern portion of Tract 24756. From 1994 through 1997, two environmental consulting firms conducted four separate sampling investigations of the stockpiles. The results above reflect the last sampling that occurred in 1996 and 1997. However, the result for EPA 418.1 was collected on September 7, 1994. In 1996, analyses included EPA Methods 8015-diesel, 418.1 (TRPH), and 8020 (BTEX and including MTBE).

³On December 27, 2001, groundwater sampling included analyses for kerosene, gasoline, and oil (EPA Method 8015-modified). In addition, the free product from wells MW-1 and MW-8 were analyzed for VOC (EPA Methods 8260B and 8015-M).

⁴On November 6, 1990, confirmation soil samples were collected after concrete tank removal and excavation activities were completed.

⁵On October 23, 1992, monitoring wells MW2 and MW12A were sampled and analyzed for EPA 418.1.

⁶On July 10, 1992, soil samples were collected from MW8-54.5', MW5-45', B13-30', MW15-40', B18-60', B19-55', and B19-65' and were also analyzed by EPA 8240 (GC/MS Semi-Volatile Organic Compounds).

⁷On December 1, 1992, groundwater samples were collected from MW11 and MW12A and were sampled by EPA Method 624.

⁸On July 10, 1992, soil samples (MW5-45', MW8-54.5, B13-30', MW15-40', B18-60', and B19-65') were collected and analyzed by EPA 8270 (GC/MS Semi-Volatile Organic Compounds). The soil results revealed maximum concentrations of Fluorene, 2-Methylnaphthalene, and Phenanthrene detected from soil samples collected from MW-8-54.5' at 1.8 ppm, 15 ppm, and 2.3 ppm, respectively.

⁹On September 1, 1992, groundwater samples were collected from wells MW11, MW12A, and MW9 and analyzed by EPA Method 625. All of the results were ND except for Fluoroanthrene and Phenanthrene detected in well MW8 at 2,000 ppb, and 2,200 ppb, respectively.

¹⁰Sample results for the last sampling event on December 12, 2003.

IV. CLOSURE

Does completed corrective action protect beneficial uses per the regional board basin plan? YES [x] NO []
Does the corrective action protect public health for current land use? YES [X] NO []

SITE MANAGEMENT REQUIREMENTS

Should corrective action be reviewed if land use changes?
YES [] NO [X]

V. ADDITIONAL COMMENTS, DATA, ETC.

Site History/Land Use:

The site consisted of Tracts 22336 through 22341, 24756, and 28703 (formerly 22335) located in the Temescal Valley area of Riverside County. From the 1920's until 1990, Tracts 22336 through 22341 were used as citrus groves. Between 1928 and 1950, three reported exploratory oil wells were drilled on Tract 24756. However, this particular tract remained undeveloped until after 1990. Diesel fuel, as well as molasses, were used on-site as smudge pot heating oil. Presently, there are single and two-story residential dwellings with associated streets and drainages, as well as a ballpark, at the site. On June 3, 1999, the RCDEH transferred this case to Regional Board-lead status.

Site Investigations/Remediation:

In 1990 and 1991, the following investigations and activities were conducted at the site:

1. In May 1990, during a large-scale grading operation in the northern portion of the site (southern portion of Tract 22336), diesel-impacted soil was detected. Subsequent site investigation included the drilling of 12 soil borings that ranged in depths from 26 to 86 feet bgs. Groundwater was encountered from 18.5 to 63 feet bgs. The soil results revealed diesel-impacted soils present between 25 and 65 feet bgs. According to the consultant, diesel contaminants may have been dumped into the southern portion of the contaminated area over a number of years prior to 1963. The diesel contamination plume then migrated, via groundwater movement, in a northwesterly direction. Four groundwater monitoring wells (MW-1 through MW-4) were installed. Free product was detected in MW-1. In addition, two unconfined aquifers and a confined aquifer were encountered beneath the site. The unconfined aquifers were divided by a north-northwest trending groundwater barrier that restricted the migration of the contaminant beneath the site.
2. At the same time, excavation activities and confirmation soil sampling were completed under the direction of CRDEH. In June 1990, approximately 10,200 cubic yards of diesel-contaminated soils were removed from the southern portion of Tract 22336 and deposited in two soil stockpiles located at the northern portion of Tract 24756.
3. In May 1990, two former above surface storage tanks (ASTs) were located and removed from the eastern portion of Tract 24756. One tank was a diesel storage tank (5 feet in diameter and 12 feet in length). According to the prior owner of Tract 24756, the second tank (6 feet diameter x 20 feet in length) was used to store molasses. On August 13, 1990, one partially buried concrete tank (17 feet in diameter x 14 feet in height) was removed and demolished. The concrete chunks were used as fill material at the site. The tank was used to store diesel fuel for the smudge pots. CRDEHS staff witnessed confirmation soil sampling.
4. A former AST was located near the westerly intersection of Clay Canyon Drive and Brown Canyon Channel prior to 1974 in Tract 22340. According to a previous field manager, the AST was utilized for oil storage only and the tank was relocated and used as a water tank during the mid-1960. There was no evidence of any contamination in this area and no further site assessment was conducted in this area.

From 1992 through 1997, subsequent investigations were conducted and are summarized below:

J. ADDITIONAL COMMENTS, DATA, ETC. – continued:

- Southern Portion of Tract 22336 and the Western Margin of Tract 22337 - Six monitoring wells (MW5, MW7 through MW10, and MW14) and five exploratory soil borings (B13, B14, B20, B21, and B22) were drilled to investigate the lateral and vertical extent of contaminated groundwater and soil. The results revealed diesel-contaminated soil present at depths between 25 and 55 feet on the southwest side of an existing north-northwest trending groundwater barrier on the western portions of Tracts 22336 and 22337, and at depths of 55 to 81 feet on the northeastern site of the barrier. Diesel free product was encountered in the southern portion of Tract 22336 in wells MW1 and MW8. In addition, crude oil was detected in the groundwater samples in 9 of the 11 wells, which ranged from ND to 9,100 ppb. Subsequent investigations included four additional soil borings (KB1 through KB4) that were drilled to 80 and 100 feet bgs and one monitoring well (MW-17). On June 26, 1991, the CRDEH issued a letter that stated no further soil investigation or remediation was required for Tract 22336. Since no diesel-contaminated groundwater was detected in wells MW7 and MW14, these wells were subsequently abandoned in March 1999.
- West of Tract 22340 - three monitoring wells (MW11 through MW13) were installed to investigate two reported abandoned oil wells located west of Tract 22340. No diesel-impacted groundwater was detected and subsequently, these monitoring wells were abandoned and no further site assessment or remediation was required.
- Tract 24756 – Two soil borings (B16 and B17) were drilled in the vicinity of the former diesel and molasses ASTs on the eastern portion of Tract 24756. Also, one well (MW16) and three borings/wells (MW15-15A, B18, and B19) were drilled in the vicinity of the three abandoned oil wells. Additional site assessment in this Tract included the identification and status of the three reported abandoned oil wells. According to the California Department of Oil and Gas (CDOG), the three wells (known as Trabuca 1, Heinlein 1, and Peter Palm) were non-producing wells and were subsequently abandoned in accordance with CDOG requirements.

In 1995 and 1996, three sampling investigations were conducted on the two diesel-impacted soil stockpiles located on Tract 24756. The stockpiles SP-15, SP-19, SP-20, SP-21, and SP-22 were placed with stockpiles SP-16, SP-17, and SP-18, within the proposed Indian Hemp Court Road. Stockpiles SP-12 and SP-13 were placed with stockpiles SP-8 through SP-11, SP-14, SP-23, and SP-24. The stockpiles were placed to form one large soil stockpile. Stockpiles SP-1 through SP-7 were combined to form one large soil stockpile. The above soils were placed using a front-end loader and a water truck for dust control. RCDEH staff approved these activities. With respect to groundwater, monitoring wells MW-2 and MW-16 revealed no contamination and these wells were subsequently abandoned in 1999 and 1997, respectively.

- Tract 22335 – In 1999, Tract No. 22335 was changed to Tract No. 28703. Currently, all six (6) existing groundwater monitoring wells are located in Tract No. 28703, which includes the ballpark. Groundwater remediation in this area included an automatic free product recovery system for wells MW-1 and MW-8. Diesel free product thickness was up to a maximum of 4.5 feet. Since March 1999, post-remedial monitoring included existing wells MW-3, MW-5, MW-9, and MW-17. Site investigation and post-remedial monitoring confirmed that the free product plume was localized in wells MW-1 and MW-8. Several years of post-remedial monitoring revealed non-detectable results during most of the sampling quarters. During the last two quarters, the free product thickness detected in wells MW-1 and MW-8 ranged between trace to non-detectable levels.

Geology and Hydrogeology:

The site was underlain by terrace and alluvial fan deposits. The encountered terrace and alluvial fan deposits primarily consisted of dense to very dense gravelly sands and sandy gravels with variable amounts of silt and cobbles. Minor amounts of shale were encountered at a depth of 85 feet in the vicinity of the western portion of Tract 22337. In addition, the southwestern portion of the adjacent Tract No. 22340 was located within the Elsinore Fault Zone.

IV. ADDITIONAL COMMENTS, DATA, ETC. – continued:

Two unconfined aquifers and a confined aquifer were encountered beneath the site. A north-northwest trending groundwater barrier divided these two aquifers. The groundwater barrier was encountered on the western portions of Tracts 22336 and 22337. The general groundwater flow gradient was toward the north and northeast.

The subject site is located within a one-mile radius of three (3) wells. The wells are located 0.23-mile east, 0.76-mile northeast, and 0.44-mile northwest of the site. It is unknown whether these wells are production, agricultural, private, active, or inactive wells.

RECOMMENDATION FOR CLOSURE

Based on the following factors, site closure is recommended for this site:

- The former USTs, ASTs, and associated piping were removed from the site. The concrete, partially buried, UST was demolished and the concrete chunks were used as fill material at the site.
- Soil and groundwater contamination plumes were fully defined. Soil and groundwater contamination was restricted in minor concentrations of crude oil (naturally occurring) and diesel. The groundwater contamination plume was localized to two adjacent monitoring wells (MW-1 and MW-8) contaminated by free product (diesel).
- Soil remediation included the excavation of approximately 10,200 cubic yards of contaminated soil. After extensive soil characterization, the RCDEH approved the use of the stockpiled soil as road base. Subsequently, the area was paved.
- From March 1, 1996 to the present, remediation included free product recovery. The initial 4.5 feet in thickness was reduced to trace amounts. A total of 1479.6 gallons of free product diesel were recovered.
- Groundwater monitoring occurred from September 1992 through December 2003. The recent dissolved phase results revealed all ND results for TPH-g, oil/kerosene (last sampled in 12/01), and all VOCs (including BTXE and all fuel oxygenates) except for TPH-d and naphthalene detected at 3400 ppb (MW9) and 2.53 ppb (MW9), respectively. The trace diesel residual contamination concentrations remaining beneath the site should not pose a threat to groundwater quality in this area.

RE: Underground Storage Tank Cleanup at Standard Concrete located on 22300 Temescal Canyon Rd Corona, CA 91719.

Dear Responsible Parties,

This letter confirms the completion of site investigation and remedial action for the underground storage tank(s) formerly located at the above described location. Thank you for your cooperation throughout this investigation. Your willingness and promptness in responding to our inquiries concerning the former underground storage tank(s) are greatly appreciated.

Based on the information in the above-referenced file, and with the provision that the information provided to this agency was accurate and representative of site conditions, no further action related to the underground tank release is required.

This notice is issued pursuant to a regulation contained in Section 2721(e) of Title 23 of the California Code of Regulations.

If you have any questions regarding this matter, please contact Dori Malloy at (909) 358-5055.

Sincerely,

Earl E. Tuntland
Assistant Environmental Health Administrator

COMMENTS (soil types, depth of remediation, etc.): All of the contamination identified was present at shallow depths immediately below the dispenser. The soil was excavated out and only residual diesel concentrations remained. The confirmation samples indicated that there was no TPH-gas, BTEX or MTBE present. Although surface water can be seen from the excavation, it is approximately 57' lower than the shallow excavation.

VII. Additional Comments, Data, Etc.

Three 10,000 gallons were removed from the site on 01/29/97 (two contained diesel, one contained gasoline). The samples collected beneath the tanks at the time of removal all indicated ND concentrations for TPH-gas & diesel, BTEX, and MTBE. The initial samples collected at 2' bgs under the dispensers showed elevated levels. The soil under the dispenser island was then excavated down to 4' bgs and confirmation samples collected. The confirmation samples showed ND concentrations for TPH-g, BTEX, and MTBE. Several of the intermediate and confirmation samples revealed low diesel concentrations, but the maximum present was 37 ppm. There was no evidence to suggest that groundwater had been impacted.

RE: Underground Storage Tank Cleanup at Villa Park Trucking located at 21880 Temescal Canyon Road in Corona, California.

Dear Mr. and Ms. Clift:

This letter confirms the completion of a site investigation and corrective action for the underground storage tank(s) formerly located at the above described location. Thank you for your cooperation throughout this investigation. Your willingness and promptness in responding to our inquiries concerning the former underground storage tank(s) are greatly appreciated.

Based on the information in the above-referenced file, and with the provision that the information provided to this agency was accurate and representative of site conditions, this agency finds that the site investigation and corrective action carried out at your underground storage tank(s) site is in compliance with the requirements of subdivisions (a) and (b) of Section 25296.10 of the Health and Safety Code and with corrective action regulations adopted pursuant to Section 25299.3 of the Health and Safety Code and that no further action related to the petroleum release(s) at the site is required.

This notice is issued pursuant to subdivision (g) of Section 25296.10 of the Health and Safety Code. If you have any questions regarding this matter, please contact Sharon Boltinghouse at (951) 955-8982.

Sincerely,

Steve Van Stockum
Director, Environmental Health

VII. Additional Comments, Data, Etc.

Site History

In 1981, two 10,000 gal USTs with two accompanying dispensers were installed at the northwestern edge of the property. On July 16, 1998, this UST system was removed in preparation for replacement upgrades. Analytical results from these soil samples indicated the presence of diesel contaminants ranging from 3.58 ppm to 4000 ppm beneath the east ends of each tank and below the western dispenser. On, July 18, 1998, immediately following the removal of the former system, a single 15000 gal UST was installed in the excavation of the former UST system. All original soils excavated during the UST removal were used as backfill during the installation. Riverside County HMMD sent a "No further action required" letter on Oct 20, 1998.

Release Information

August 2006 - The 15,000 gal UST system was removed. A total of three soil samples were collected beneath the UST. No dispenser or piping samples were collected. The sample collected at 11.5 ft bgs beneath the former turbine showed 370 ppm TPHd, 0.007 ppm Naphthalene, 0.003 n-Propylbenzene, 0.031 ppm 1,2,4-Trimethylbenzene, 0.008 ppm 1,3,5-Trimethylbenzene, 0.004 ppm Xylene, 0.010 ppm n-Butylbenzene, 0.003 sec-Butylbenzene. The chain of

CASE CLOSURE SUMMARY LEAKING UNDERGROUND FUEL STORAGE TANK PROGRAM

SITE NAME: Villa Park Trucking

SITE NO: 200622897

custody indicated that the samples were not sealed, however, the field report indicates that the samples were sealed.

Based on recent sample results and impacts detected in 1998, the site was entered into LOP on 9/18/2006 for further assessment.

Soil Assessment and Verification:

December 2006 - Three soil borings were drilled to approximately 60 ft bgs. Soil samples were collected at 5 ft intervals starting at 5 ft bgs and ending at 60 ft bgs. Diesel contamination was identified in five samples at 14 ppm (B2@55'), 16 ppm (B2@60'), 66 ppm (B3@50'), 27 ppm (B3@55'), 26 ppm (B3@60'). Toluene was identified in 5 samples at 0.002 ppm (B1@40' and 60'), 0.002 ppm (B2@40'), 0.004 ppm (B2@45'), 0.002 ppm (B3@60'). No other VOCs were detected. 8260 Full-scan run.

RCDEH required further assessment based on the following: 1) Detections in the bottom of the boring and lack of 40-ft clean zone; 2) Close proximity to Temescal Creek; and 3) Lack of nearby depth to groundwater data.

Groundwater Monitoring and Verification:

One groundwater monitoring well was installed on October 12, 2007. Soil samples were collected at 5 ft intervals beginning at 5 ft bgs to 50 ft bgs. Well is screened between 40 ft to 62 ft bgs. All soil samples were ND for all constituents tested. Maximum groundwater concentrations from the grab groundwater sample were 0.43 ppm TPHd, and 2.4 ppb 1,1-Dichloroethene. ND for all other constituents tested.

Five groundwater monitoring events were conducted between October 2007 and August 2009. Water levels have fluctuated from 49.65 ft bgs to 52.20 ft bgs. Flow direction is estimated to be easterly towards Temescal Wash. Maximum groundwater concentrations during monitoring events were: 0.43 ppm TPHd, 3.2 ppb 1,1-Dichloroethene, 0.67 ppb Trichlorofluoromethane, 10 ppb Trichloroethene. ND for all other constituents tested.

Remediation: No active remediation has taken place. All initial concentrations remain in-situ.

Soil types: Well sorted fine to coarse grained sands throughout with thin layers of clayey sands.

Historical Depth To GW: 49.65 ft bgs to 52.20 ft bgs **Current Depth To GW:** 50.66 ft bgs

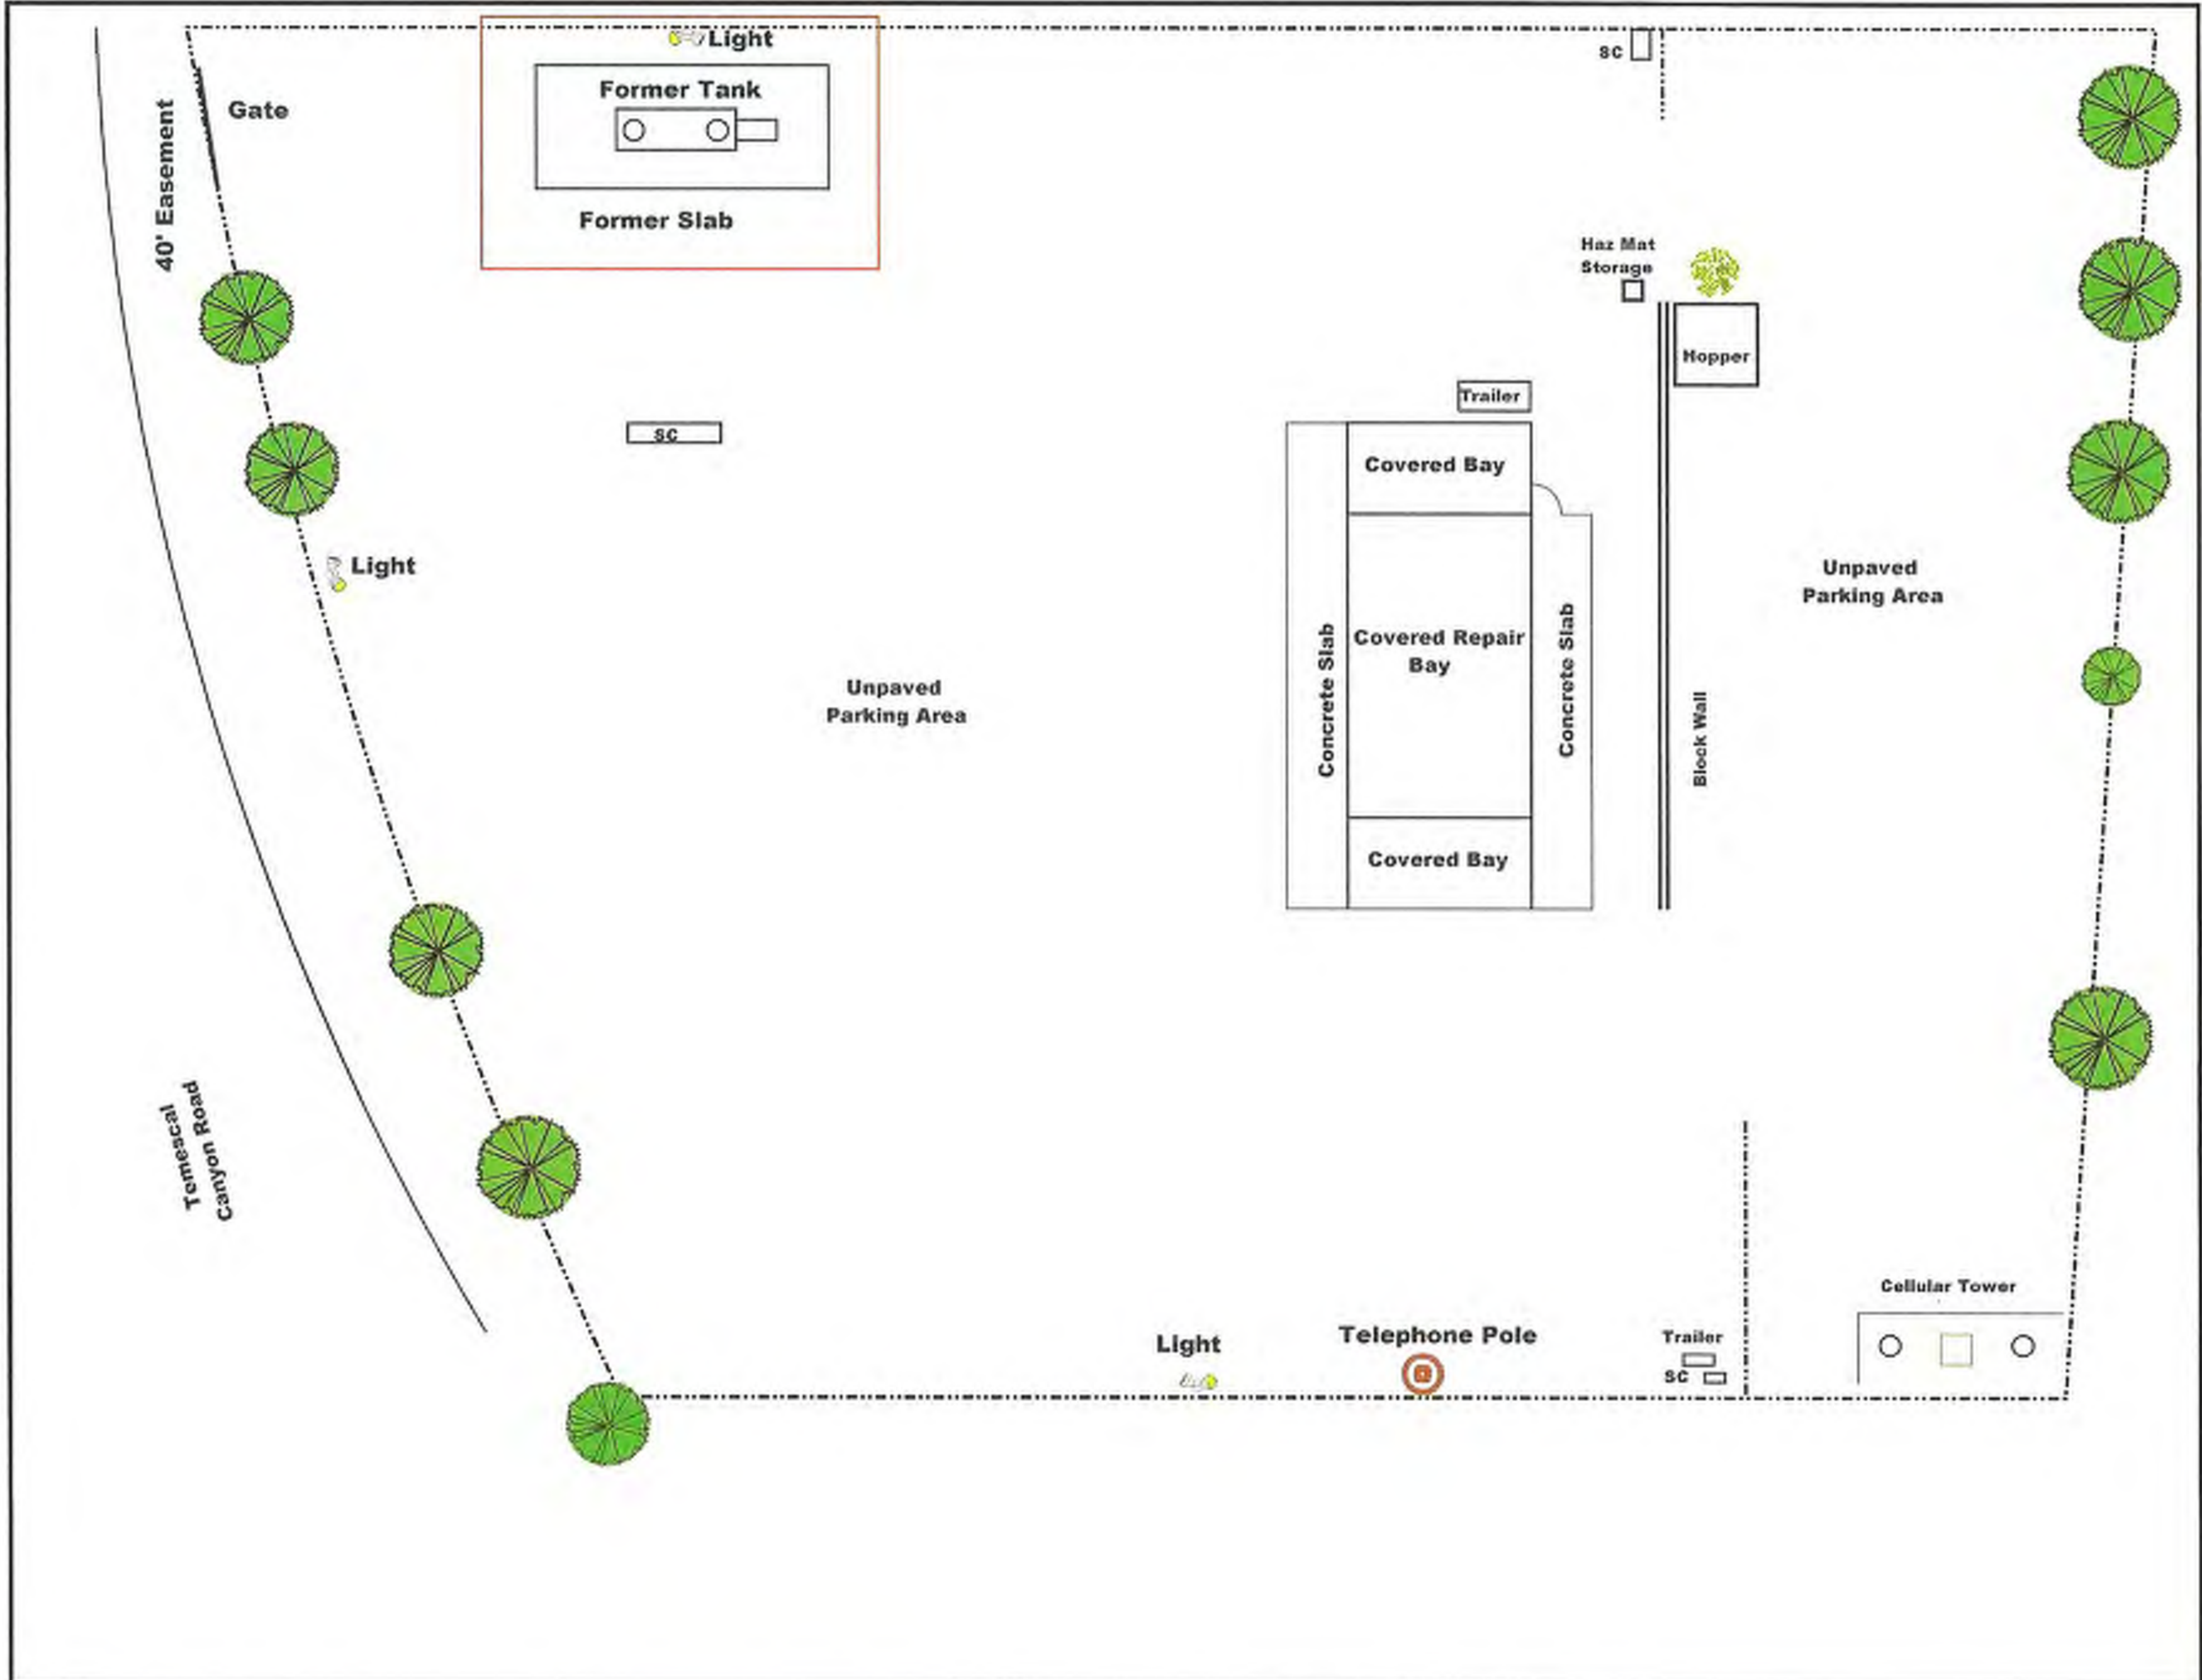

GW Flow: Easterly towards Temescal Wash

Remediation: All initial concentrations remain in-situ. No remediation has taken place.

Nearest Sensitive Receptor: The site is located approximately 1300 feet east from Temescal Wash and is within the recharge zone for Temescal Creek. Nearest municipal well is approximately 1.27 miles southeast of the site.

NOTE: This closure summary does not include all of the data for this cleanup. It was prepared by the Riverside County DEH for the purpose of providing a brief summary for case closure evaluation. The *Additional Subsurface Site Assessment Report (Kendall Compliance Corp, January 8, 2007)* and all other environmental reports pertaining to this cleanup site as well as the RCDEH Local Oversight Program case file should be reviewed in their entirety to obtain further details regarding this cleanup.

SOIL

Site History

The site was vacant, undeveloped land from approximately 1931 to the 1950s when the site was developed by Liston Brick Company for the manufacturing of bricks and other clay prod In 1975, the site was redeveloped as Liston Aluminum Brick Company (Liston) of Corona. The site formerly contained multiple buildings that totaled approximately 56,000 square feet ar included an aluminum foundry with furnaces, two dryer buildings, two warehouse buildings, a bag house, a mechanics shop, a laboratory, three electrical buildings, a personal storage building, and an office building. Liston received aluminum scrap that was smelted in furnaces, and cast in molds to form aluminum foundry ingots, which were sold to manufacturers.

Activities occurred and Contaminants Historical environmental investigations performed at the site (tank removal, U.S. Environmental Protection Agency sampling, environmental site assessments, and site investigations from 1993 through 2009 revealed soil contamination. Elevated levels of Total Petroleum Hydrocarbons (TPHs), Polycyclic Aromatic Hydrocarbons (PAHs), Volatile Organic Compounds (VOCs), and metals in soil were found in the soil (from surface to up to 15 feet below ground surface [bgs]). Environmental site assessments for the Liston property determined the contamination was attributed to past on-site operations in various areas of the site.

Present Status:Riverside County Transportation Commission (RCTC) purchased ownership of the property from Liston on December 11, 2013. As a result of the contamination found at site, RCTC entered into a Voluntary Cleanup Agreement (VCA) with the DTSC to oversee cleanup activities. All the contaminated soil was removed and shipped off-site. 5,719 tons of sc removed.

The soil was removed to meet residential cleanup levels on a point by point basis to protect future users of the site from direct contact with soil. Only a small amounts of individual sampl locations remaining are above a cleanup goal (for three metals), and when considering the 95% UCL on the mean concentration, are below cleanup goals and are acceptable.

The Department has determined that all appropriate response actions have been completed, that all acceptable engineering practices were implemented and that no further removal/ren action is necessary.

The site is ultimately planned to be developed a roadway as part of the western portion of the Mid-Valley Parkway Transportation Project, which will run from the I-15 to I-215. In the inter RCTC is planning to use the Site for a Park and Ride Facility prior to construction of the freeway.

SOIL REMOVAL ACTION COMPLETION REPORT, LISTON ALUMINUM BRICK COMPANY, 3710 TEMESCAL CANYON ROAD, CORONA, CALIFORNIA

Dear Mr. Lancaster:

The California Department of Toxic Substances Control (DTSC) has reviewed the above referenced document dated July 9, 2015 prepared by Ninyo & Moore. The report documents soil removal, confirmation sampling, and air monitoring program for the Liston Aluminum Brick Company (Liston) property at 3710 Temescal Canyon Road in Corona. The Removal was accomplished in accordance with the Final Removal Action Work Plan approved by DTSC on September 4, 2014.

The Riverside County Transportation Commission (RCTC) purchased the property from Liston on December 11, 2013. The RCTC entered into a Voluntary Cleanup Agreement (VCA) with the DTSC to oversee cleanup activities at the site. The site is ultimately planned to be developed as a roadway part of the western portion of the Mid-Valley Parkway Transportation Project which will run from the I-15 west of the site to the I-215 to the east. The RCTC is planning to use the site for a Park and Ride Facility until the Mid-Valley Parkway Project is constructed.

The site was vacant, undeveloped land from approximately 1931 to the 1950s when the site was developed by Liston Brick Company for the manufacturing of bricks and other clay products. In 1975, the site was redeveloped as Liston Aluminum Brick Company of Corona. The site formerly contained multiple buildings that totaled approximately 56,000 square feet and included an aluminum foundry with furnaces, two dryer buildings, two warehouse buildings, a bag house, a mechanics shop, a laboratory, three electrical buildings, a personal storage building, and an office building. Liston received aluminum scrap that was smelted in furnaces, and cast in molds to form aluminum foundry ingots, which were sold to manufacturers.

Mr. Lancaster
July 14, 2015
Page 2

Historical environmental investigations were performed at the site (tank removal, environmental site assessments, and site investigations [SIs]) from 1993 through 2009. These investigations revealed elevated levels of Total Petroleum Hydrocarbons (TPHs), Polycyclic Aromatic Hydrocarbons (PAHs), Volatile Organic Compounds (VOCs), and metals in soil up to 15 feet below ground surface. The soil was removed to meet residential cleanup levels on a point by point basis to protect future users of the site from direct contact with soil based on the subject Completion Report.

The uncertainties that remain as potential risks to users of the future parking and roadway include unknown materials which were not found but which might be encountered during redevelopment. Different future land uses may have additional uncertainties due to other exposure pathways that are not considered for a parking lot or roadway.

Based on the site historic information, previous investigations, the results of the confirmation sampling, and the post-removal action data analysis, DTSC concurs with the site closure recommendation and a No Further Action is hereby issued for the Site.

Thank you for your cooperation. If you have any questions, please contact Anantaramam Peddada, Project Manager at (714) 484-5418.

Sincerely,

Dear Sir:

Subject : Underground Storage Tank Cleanup at Liston Aluminum
located at 20401 Temescal Canyon Road in Corona.

This letter confirms the completion of site investigation and remedial action for the underground storage tanks at the above site. Based on the assumption that the information provided to this agency was accurate and representative of existing conditions, it is the position of this office that no further action is required at this time.

The contents of these reports have also been discussed with staff of the Regional Water Quality Control Board (RWQCB). Based on the information submitted and current requirements, the RWQCB concurs with the determination of this agency that no further action is required at this time.

Please be advised that this letter does not relieve you of any liability under the California Health and Safety Code or Water Code for past, present, or future operations at the site. Nor does it relieve you of the responsibility to clean up existing, additional or previously unidentified conditions at the site which cause or threaten to cause pollution or nuisance or otherwise pose a threat to water quality or public health.

Additionally, be advised that changes in the present or proposed use of the site may require further site characterization and mitigation activity. It is the property owner's responsibility to notify this agency of any changes in report content, future contamination findings, or site usage.

If you have any questions regarding this matter, contact this office at (909) 358-5055.

Sincerely

Christine Jones

COMMENT:

LISTON ALUMINUM

Site # 93319 Corona

TYPE OF CONTAMINATION: Soil

DEPTH TO GROUNDWATER: 19 feet (estimated)

SITE SUMMARY:

On March 19, 1993, two tanks (250 gallon and 500 gallon gasoline) were removed (210 ppm TPH 8015, benzene ND<5 ppb at 2 feet below the tank and 110 ppm TPH 8015 and benzene ND<5 ppb at 6 feet below the tank). On May 4, 1993, soil was excavated from the pit and confirmation samples were collected from the bottom and side walls. Bottom of excavation was approximately 12 below ground surface. 54 ppm TPH (8015) was detected in the sample from the east wall (no benzene). On May 11, 1993, soil was excavated from the east wall and confirmation sample collected. Confirmation sample was ND for TPH and BTEX.

Excavated soil was stockpiled on visqueen and covered with visqueen. RP believed that the contractor had excavated more soil than was necessary (i.e., clean soil). Stockpile was sampled and all samples were ND for TPH and BTEX.

Mr. Howard Hall
Liston Brick Company
PO Box 1869
Corona CA 91718

Dear Mr. Hall:

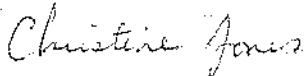

RE: Liston Aluminum - 20401 Temescal Canyon Road - Corona

The purpose of this letter is to inform you that Riverside County Department of Environmental Health, Hazardous Materials Management Division has entered into an agreement with the State of California Water Resources Control Board to oversee the cleanup and mitigation of contaminated sites resulting from the unauthorized release of hazardous substances from underground storage tanks. The cleanup of these sites is necessary to protect the groundwaters of the state from contamination and to protect the public from exposure from hazardous chemicals.

The oversight program developed by the State and administered by the County is funded by State and Federal monies and is subject to reimbursement by the responsible parties for each specific site. The County will account for time and materials expended at each cleanup site. On a routine basis, the State will be provided with the amounts detailing the time and expenses. The State will then invoice the responsible party for all direct and indirect cost associated with the cleanup of the site.

Enclosed you will find the Notice of Reimbursement. This is the formal notification concerning the reimbursement requirements for the responsible party. If any of the information is incorrect or if you should have any questions, contact this office as soon as possible at (909) 358-5055.

Sincerely

Christine Jones

The Federal Petroleum Leaking Underground Storage Tank Trust Fund (Federal Trust Fund) provides funding to pay the local and state agency administrative and oversight costs associated with the cleanup of releases from underground storage tanks. The Legislature has authorized funds to pay the local and state agency administrative and oversight costs associated with the cleanup of releases from underground storage tanks. The direct and indirect costs of site investigation or remedial action at the above site are funded, in whole or in part, from the Federal Trust Fund. The above individual(s) or entity(ies) have been identified as the party or parties responsible for investigation and cleanup of the above site. YOU ARE HEREBY NOTIFIED that pursuant to Title 42 of the United States Code, Section 6991b(h)(6) and Sections 25297.1 and 25360 of the California Health and Safety Code, the above Responsible Party or Parties must reimburse the State Water Resources Control Board not more than 150 percent of the total amount of site specific oversight costs actually incurred while overseeing the cleanup of the above underground storage tank site, and the above Responsible Party or Parties must make full payment of such costs within 30 days of receipt of a detailed invoice from the State Water Resources Control Board.

TOXIC SUBSTANCES CONTROL DIVISION
REPORT OF HAZARDOUS WASTE SITE CLEANUP

Name of Site Cleaned Up: Liston Aluminum Company Site
 Date Cleanup Completed: 10/18/85
 Location of Site: 9107 Cajalco Road, Corona, CA, Riverside County
 Site AKA: See above
 Is this a Superfund Site? No
 Brief History of the Site:

Approximately 25 tons of hazardous waste were deposited at the above address in June, 1984. The site is adjacent to a stream bed and near drinking water wells. This material was sampled, tested and found to contain hazardous levels of zinc and lead.

Cleanup/Remedial Action Taken:

The hazardous waste was removed from the property at 9107 Cajalco Road and is currently being processed. The processing is scheduled to be completed by November 8, 1985. (Inventory list is available).

State Role in Cleanup:

DOHS sampled the site in July, 1985. A Notice of Violation was issued at that time which ordered Liston to remove this hazardous waste. A clean-up letter was subsequently issued. A variance to haul and re-process this hazardous waste was granted to Liston at 20401 Temescal Canyon Road, Corona.

Cleanup Cost: estimated at \$15,000

**NO FURTHER ACTION (NFA) DETERMINATION, GATEWAY BUSINESS PARK, 20325
TEMESCAL CANYON ROAD, CORONA, CALIFORNIA
(GeoTracker ID # T10000000196, PCA #2080075)**

Dear Mr. Thayer:

We have reviewed the historical data for the Gateway Business Park, LLC (the Site), and the summary that was submitted to us by AMEC Foster Wheeler (AMEC FW) on July 10, 2015 on your behalf. Listed below are a description of the work that was conducted during mine reclamation activities at the Site, and a discussion of the impacts to groundwater, specifically volatile organic compounds (VOCs), that were identified in a limited area at the Site.

Background

Excavation of the Site was conducted under Riverside County Mine Reclamation permit No. 109. The Site had been part of a sand and clay mine operation as early as the 1950's.

Low levels of VOCs including trichloroethene (TCE), cis-1,2 dichloroethene (cis-1,2 DCE), 1,3,5-trimethylbenzene, and chloroform were detected in groundwater at one area of the site during a subsurface investigation in 2000. Review of historical aerial photographs and borings logs identified the Site as a former mining pit that had been used to dispose of waste including brick, wood, and other inert debris. A report of findings was submitted to our staff, with the conclusion that the source of these low level detections of VOCs was unknown, and that additional work would be conducted during excavation (Geomatrix Consultants, Inc., 2000, Results of Limited Subsurface Investigation of the Excavation Pit at the Former CISCO Lease, June 8.)

Mine reclamation of the disposal area began in late 2007 under the South Coast Air Quality Management District (SCAQMD) Rule 1150 permit for excavation of refuse at a landfill. Refuse materials unsuitable for fill (wood, metal, rubber, etc.) were removed from the excavated materials, and transported from the site for disposal. Soils were placed back in the excavation as engineered fill. In March 2008, groundwater was encountered in the excavation, and was sampled and analyzed. The water sample result showed detections for vinyl chloride (37 micrograms per liter, µg/L) and benzene (1.76 µg/L). Additional samples of the ponded water in May and April 2008 indicated the presence of VOCs: vinyl chloride (up to 282 µg/L), cis-1,2-DCE (up to 40.8 µg/L), trans-1,2-dichloroethene (trans-1,2-DCE; 4.29 µg/L), TCE (up to 15.5 µg/L), and benzene (up to 3.87 µg/L). Concentrations were highest near the northern property boundary.

Gateway Business Park notified us of the VOC-affected groundwater, and submitted an application for the General Permit to Discharge Treated Groundwater under Regional Board General Order R8-2007-008 to us in June 2008. Analytical results of the groundwater sampling in the excavation were summarized in the permit application. The permit was approved by the Regional Board in August 2008. The prescribed groundwater treatment system consisted of granular activated carbon adsorption. It was installed, and then operated for about 1 day before the excavation activities were suspended; it was operated for a second day as part of demobilization of excavation equipment.

AMEC FW submitted a summary of the groundwater treatment system operations and laboratory analyses to us on December 17, 2008. Groundwater was extracted for treatment from ponded water in the southern end of the excavation. The only VOC detected in the ponded water sampled as the influent into the treatment system was vinyl chloride, which was detected at a concentration of 4.89 µg/L.

In December 2008, Site development was suspended, pending improvements in the economy. The groundwater treatment system was shut down, dismantled, and removed from the site. In January 2012, in preparation for renewed Site work, a groundwater sample was collected from the pond at the bottom of the excavation and analyzed for water quality parameters to support efforts to obtain a permit to discharge this pond water to the storm drain system that flowed to Temescal Creek. Laboratory analyses did not indicate the presence of VOCs at or above the laboratory reporting limits, and no other constituents were detected that would cause concern for the discharge of the pond water to Temescal Creek. Four additional supplemental samples of the pond water were collected and analyzed for VOCs between February 3, and February 21, 2012 and these laboratory results indicated no detectable VOCs.

On March 1, 2012, the SARWQCB issued permit R8-2009-0003-087, NPDES permit GAG998001 to discharge water from the pond to Temescal Creek. Between July 10, 2012 and August 27, 2012, approximately 11.3 million gallons of water were pumped from the excavation. AMEC continued to monitor the discharged water for compliance with the NPDES permit and the pond water for VOCs. VOCs were not detected at or above laboratory reporting limits in samples collected from the pond as the pond was dewatered. Reclamation activities continued on the property in late 2012, and were completed at the end of 2013 with the Site completed to finished grade with engineered fill.

AMEC FW has indicated that the Site will be sold for development. AMEC FW believes that the VOCs at the Site may have originated from a localized source within the refuse materials that were formerly buried at the Site, or from an offsite source in groundwater. The source of contamination appears to have been of limited volume, and VOCs have not been detected in water at the Site since 2008. On behalf of Murdock Realty, LLC, successor to Gateway Business Park LLC, Amec Foster Wheeler has requested closure for the Site for groundwater impacts identified for treatment under the NPDES permit issued in August 2008.

No Further Action (NFA) Determination

Based on our review of the data and the reclamation activities at the Site, we believe that the VOC impacts to groundwater and surface water at the Site have been eliminated, and do not pose a threat to the beneficial uses of Temescal Creek or the Temescal Groundwater Management Zone. Therefore, on the condition that the information provided to us is accurate

Dear Mr. Adley:

Subject: Corona Trucking - 19885 Temescal Canyon Road - Corona

This letter confirms the completion of site investigation and remedial action for the underground storage tanks at the above site. With the provision that the information provided to this agency was accurate and representative of existing conditions, it is the position of this office that no further action is required at this time.

The contents of these reports have also been discussed with staff of the Regional Water Quality Control Board (RWQCB). Based on the information submitted and current requirements, the (RWQCB) concurs with the determination of this agency that no further action is required at this time

Please be advised that this letter does not relieve you of any liability under the California Health and Safety Code or Water Code for past, present, or future operations at the site. Nor does it relieve you of the responsibility to clean up existing, additional or previously unidentified conditions at the site, which cause or threaten to cause pollution or nuisance or otherwise pose a threat to water quality or public health.

Additionally, be advised that changes in the present or proposed use of the site may require further site characterization and mitigation activity. It is the property owner's responsibility to notify this agency of any changes in report content, future contamination findings, or site usage.

If you have any questions regarding this matter, contact this office at (909) 358-5055.

Sincerely,

Doug Thompson
Hazardous Materials Specialist

RE: Underground Storage Tank Cleanup at Wayside Dairy, 19630 Temescal Canyon Road,
Corona

Dear Responsible Party:

This letter confirms the completion of site investigation and remedial action for the underground storage tank(s) formerly located at the above described location. Thank you for your cooperation throughout this investigation. Your willingness and promptness in responding to our inquiries concerning the former underground storage tank(s) are greatly appreciated.

Based on the information in the above-referenced file, and with the provision that the information provided to this agency was accurate and representative of site conditions, no further action related to the underground tank release is required.

This notice is issued pursuant to a regulation contained in Section 2721(e) of Title 23 of the California Code of Regulations.

If you have any questions regarding this matter, please contact Dori Malloy at (909) 358-5055.

Sincerely,

Earl E. Tuntland

OTHER						

COMMENTS (soil types, depth of remediation, etc.): Multiple monitoring wells (6) have been installed during several phases. The 6 wells have been monitored for 4 consecutive quarters with extremely low contaminant concentrations detected. A total of 170 cubic yards of contaminated soils were excavated from the former tank cavity. There is a small amount of residual contamination in place around an inactive dispenser island, but it cannot be accessed without jeopardizing the structural integrity of the dispenser island and the canopy.

IV. Closure

DOES COMPLETED CORRECTIVE ACTION PROTECT EXISTING BENEFICIAL USES AS PER THE REGIONAL BOARD BASIN PLAN? Yes <input checked="" type="checkbox"/> No <input type="checkbox"/>
DOES COMPLETED CORRECTIVE ACTION PROTECT POTENTIAL BENEFICIAL USES PER THE REGIONAL BOARD BASIN PLAN? Yes <input checked="" type="checkbox"/> No <input type="checkbox"/>
DOES THE CORRECTIVE ACTION PROTECT PUBLIC HEALTH FOR CURRENT LAND USE? Yes <input checked="" type="checkbox"/> No <input type="checkbox"/>
SITE MANAGEMENT REQUIREMENTS: Delineate around inactive dispenser island when remodeled.
SHOULD CORRECTIVE ACTION BE REVIEWED IF LAND USE CHANGES? Yes <input checked="" type="checkbox"/> No <input type="checkbox"/>
MONITORING WELLS DECOMMISSIONED? Yes <input checked="" type="checkbox"/> No <input type="checkbox"/> None Installed <input type="checkbox"/> will be NUMBER DECOMMISSIONED: 6 NUMBER RETAINED: 0

SIGNATURE: *[Signature]* DATE: 12/18/97

VII. Additional Comments, Data, Etc.

Three 10,000 gallon USTs, which formerly held gasoline, were removed from the site in December 1991. Two additional USTs (which currently contain gasoline) were installed at approximately the same time at a different location on site. The newer USTs are still operational. Site assessment was conducted in phases over time (and by various consulting firms). Three groundwater monitoring wells were installed in 1993, but they were sampled only once. In 1995 170 cubic yards of contaminated soil was excavated and removed from the former UST cavity. The majority of side wall samples collected after the excavation were ND, but there was a vein of contamination identified adjacent to the inactive dispenser island. The vein could not be excavated out without causing damage to the structural integrity of the dispenser island and the canopy. In 1996 three additional groundwater monitoring wells were installed and quarterly monitoring was instituted. The data collected indicated that groundwater could be as shallow as 12' bgs or as deep as 20' bgs. Three borings were hand-augered around the inactive dispenser island to better investigate the discolored soil observed during the excavation. The samples collected in this area indicated that there may be some residual contamination still in place, but that it's minimal (Highest TPH(g) = 10 ppm, Benzene = 8 ppb, MTBE = 8 ppb). All six wells have been monitored and sampled for four consecutive quarters. All contaminant levels are extremely low, and are far below the low risk criteria.

**RE: Underground Storage Tank Cleanup
76 Station #0522
19570 Temescal Canyon Road
Corona, California
RCDEH Site # 200824962**

Dear Responsible Parties:

This letter confirms the completion of a site investigation and corrective action for the underground storage tank(s) located at the above described location. Thank you for your cooperation throughout this investigation. Your willingness and promptness in responding to our inquiries concerning the underground storage tank(s) are greatly appreciated.

Based on the information in the above-referenced file, and with the provision that the information provided to this agency was accurate and representative of site conditions, this agency finds that the site investigation and corrective action carried out at your underground storage tank(s) site is in compliance with the requirements of subdivisions (a) and (b) of Section 25296.10 of the Health and Safety Code and with corrective action regulations adopted pursuant to Section 25299.3 of the Health and Safety Code and that no further action related to the petroleum release(s) at the site is required.

Claims for reimbursement of corrective action costs submitted to the Underground Storage Tank Cleanup Fund more than 365 days after the date of this letter or issuance or activation of the Fund's Letter of Commitment, whichever occurs later, will not be reimbursed unless one of the following exceptions applies:

- Claims are submitted pursuant to Section 25299.57, subdivision (k) (reopened UST case); or
- Submission within the timeframe was beyond the claimant's reasonable control, ongoing work is required for closure that will result in the submission of claims beyond that time period, or that under the circumstances of the case, it would be unreasonable or inequitable to impose the 365-day time period.

76 Station #0522
November 1, 2013
Page 2

This notice is issued pursuant to subdivision (g) of Section 25296.10 of the Health and Safety Code. If you have any questions regarding this matter, please contact Sharon Boltinghouse at (951) 955-8982.

Sincerely,

Steve Van Stockum
Director, Environmental Health

Date Submitted To RWQCB:	Date Signed By RWQCB: <i>June 11, 2013</i>
RWQCB Staff Assigned To Case: Nancy Olson-Martin	
RWQCB Response: <i>Concurs w/ closure</i>	
Signature: <i>Kenneth R. Willing</i>	Title: <i>Chief, UST Section</i>

VII. Additional Comments, Data, Etc.

<p>CURRENT SITE USE:</p> <p>The site is an active service station with two 12,000 gallon gasoline underground storage tanks, two product islands, and a station building convenience store.</p> <p>SITE HISTORY / RELEASE INFORMATION:</p> <p>December 1998 - Two 10,000 gallon single-walled steel gasoline USTs and single-walled fiberglass piping were removed and replaced in the same location. Ten soil samples were collected below the piping and USTs from 3 feet to 18 feet below grade (ft bg). During tank excavation groundwater (GW) was observed in the tank cavity at an approximate depth of 17 ft bg. Soil samples were analyzed for gasoline using EPA Method 8015, and BTEX and MTBE using EPA Method 8020A. Sample T-2-4-2 contained detectable concentrations of TPHg at 810 ppm, 6.4 ppm Ethylbenzene, 9.1 ppm Xylene. Soil sample T-1-3-2 contained 0.033 ppm of MTBE (6.2 ppm MTBE confirmed by EPA Method 8260). The remaining soil samples were non-detect (ND) for all constituents analyzed.</p>
--

CASE CLOSURE SUMMARY

LEAKING UNDERGROUND FUEL STORAGE TANK PROGRAM

Site Name: 76 Station #0522

Site No: 200824962

January 2005 – According to the *Request for Site Closure* dated January 31, 2013, the dispenser and product piping was upgraded. 137 cubic yards of soil was excavated. Soil samples (DS-1, DS-2) were collected at four feet beneath each dispenser. Soil samples (P-1, P-2) were collected at four feet and five feet respectively, beneath the piping. All soil sample results were ND for TPHg, BTEX, MTBE, TBA, DIPE, ETBE, TAME and ethanol. The dispenser islands were moved during this upgrade or the 1998 UST replacements.

ASSESSMENT

November 2007- A baseline (Due Diligence) assessment was conducted for potential property transfer. Five borings (B-1 through B-5) were advanced near the existing USTs and fuel dispensers to approximate depths of 25 ft bg. Select soil and GW samples were analyzed for TPH (gasoline and diesel range) using EPA Method 8015 and for full scan VOCs using EPA Method 8260. Only one soil sample was tested from each boring (B-1, B-3, B-4, B-5 at 20 ft bg and B-2 at 25 ft bg). All soil samples were ND for all constituents tested except TPHd at a maximum concentration of 4.4J ppm (B-3-S-20'). GW was encountered in borings B-1 through B-5 at an approximate depth of 20 ft bg and GW grab samples were collected from each borehole. GW sample results showed maximum concentrations in B-3 (54 ppb TPHg, 1500 ppb TPHd, 0.54 ppb benzene, 3.0 ppb toluene, 0.69 ppb ethylbenzene, 3.1 ppb xylenes, 0.18 ppb chloroform, 0.13 ppb n-propylbenzene, 0.49 ppb 1,2,4-TMB, 0.32 ppb 1,3,5-TMB, and ND for all other constituents analyzed). Site was entered into LOP in 2008.

February 2009 - Three GW monitoring wells (MW-1, MW-2, and MW-3) were installed south, west and east of the former UST excavation area. GW levels in the wells were between approximately 17 and 18 ft bg. The wells were screened from 10 to 30 ft bg (MW-1 and MW-3) and 15 to 30 ft bg (MW-2). Soil samples were collected every five feet to the bottom of the boring and analyzed for TPHg, TPHd, and full scan VOC's using EPA Method 8260. TPHd was detected in three soil samples from wells MW-2 and MW-3 with a maximum concentration of 8.2 mg/kg (MW-3 @ 30 ft). All other soil samples were ND for all constituents analyzed.

VERIFICATION

December 2010 – One Geoprobe boring (GP-1) was advanced south of the former UST excavation area to a depth of approximately 30 ft bg. GW was encountered at approximately 20 ft bg. Soil samples were collected at five foot intervals, beginning at 10 ft bg. A grab GW sample was collected from two feet below the GW surface. Soil and GW samples were analyzed for TPH (C6-C44) using EPA Method 8015B and full scan VOCs using EPA 8260B. All soil samples were ND for all constituents analyzed. All grab GW samples were ND for all constituents analyzed except for 84 ppb TPH (C6-C44) however, the laboratory analytical report case narrative stated that the sample chromatography is not typical of either Gasoline or Diesel fuels.

GROUNDWATER MONITORING:

GW monitoring has been conducted from March 2009 to August 2012 in MW-1, MW-2 and MW-3. GW samples from all three wells have been ND for all constituents of concern with the exception of TPH-d observed in MW-2 at 66 ppb in June 2011 and 260HD ppb in August 2012. "J" value VOCs were detected in the GW grab sample from B-3 and have since been ND in all sampling events from all of the monitoring wells.

REMEDIATION: All initial concentrations remain in-situ. No remediation has taken place.

NOTE: This closure summary does not include all of the data for this cleanup. It was prepared by the Riverside County DEH for the purpose of providing a brief summary for case closure evaluation. The *Request for Site Closure* (Antea Group, January 31, 2013) and all other environmental reports pertaining to this cleanup should be reviewed to obtain further details regarding this cleanup.

EXPLANATION

- MW-3  GROUNDWATER MONITORING WELL LOCATION
- B-3  SOIL BORING LOCATION
- GP-1  GEOPROBE LOCATION

DEPARTMENT OF ENVIRONMENTAL HEALTH

March 27, 1996

Rori Magnuson
Magnuson Tire & Wheel Service
1555 University Avenue
Riverside, Ca. 92507

Dear Mr. Magnuson,

UNDERGROUND STORAGE TANK (UST) CASE
El Cerrito Arco located at 19501 Ontario Avenue in Corona.
Site # 92-143

This letter confirms the completion of site investigation and remedial action for the underground storage tank(s) located at the above-described location.

Based upon the available information, including the current land use, and with the provision that the information provided to this agency was accurate and representative of site conditions, no further action related to the underground storage tank release is required.

This notice is issued pursuant to a regulation contained in Title 23, California Code of Regulations, Division 3, Chapter 16, Section 2721 (e). If the property owner proposes to change the land use so as to require approval by the local planning agency, the owner should promptly notify this agency.

Please telephone Dori Malloy at (909) 358-5055 if you have any questions regarding this matter.

Sincerely,

Earl E. Tuntland
Hazardous Materials Program Manager

COMMENTS (soil types, depth of remediation, etc.): The contamination related to the tanks on site was remediated (except for a pocket of approx. 25 cu. yards of 370 ppm TPH still in place). There is, however, a vein of contamination TPH-G at approximately 20' bgs which appears to have resulted from an unknown off-site source. The off-site source concentrations range from 380-5100 ppm but show that there were clean samples beneath them.

VII. Additional Comments, Data, Etc.

Four ust's were removed in December 1991. There was contamination beneath all of the tanks to a depth of approximately 13' bgs. The majority of contamination was excavated out and put into stockpiles. There was a small pocket of contamination TPH-G (25 cu. yds) left in place from 7'-13' bgs. An unexpected vein of gasoline contamination was then detected at approximately 20' bgs on the northern side of the property in June of 1992. The contamination exhibited concentrations of 380-5100 ppm TPH-G. There were samples taken beneath the contamination which were ND (5' and 10' below the last known contamination) and provided a buffer zone between the contamination and the area thought to be the capillary fringe. The contamination appears to have migrated from across the street but the source is still unknown. As the RP of the site did successfully remediate the contamination which resulted from the tanks on site, and since the contamination from under the street does not appear to be related to the site, the LOP oversight appears to be complete. The file should, however, reflect that there is contamination present which may need to be dealt with at a future time if the land use changes.

CASE CLOSURE AT SOUTHERN CALIFORNIA EDISON COMPANY CHASE SUBSTATION EXCESS PROPERTY, 1390 E. ONTARIO AVENUE, CORONA, RIVERSIDE COUNTY

Dear Mr. Landler:

We have reviewed the August 26, 1998, Soil Remediation Closure Report for the Southern California Edison (SCE) Company Chase Substation excess property located at 1390 E. Ontario Avenue in the City of Corona. The above report was prepared by Clayton Environmental Consultants (Clayton).

In November 1986, a release of smudge pot oil was discovered during preliminary site screening conducted by SCE staff. Further investigations to determine the extent of soil impacted with smudge pot oil were conducted by ERM-West in 1987 and Brown and Caldwell Consultants in 1991. The results of these investigations were provided to Board staff in 1992. The scope of work completed during the above site investigations included drilling 12 soil borings and digging 7 trenches. The results of the above investigations indicated that the subsurface soil beneath two former above ground smudge pot oil storage tanks had been found to contain petroleum hydrocarbons as high as 32,400 milligrams per kilogram (mg/kg), with the highest concentrations found approximately between 10 and 30 feet below ground surface (bgs)

In June 1992, SCE submitted a work plan to further evaluate the lateral and vertical extent of hydrocarbon-affected soil in the vicinity of the former leaking smudge pot oil tanks as well as along the eastern side of the property, along the western shoulder of Compton Avenue. The scope of that investigation included collection and chemical analysis of soil samples from five borings, advancement of one boring to groundwater, and collection of a groundwater sample for analysis for aromatic hydrocarbons and Total Petroleum Hydrocarbons (TPH), modified for gasoline and diesel fuel. In addition, soil samples were collected for the purpose of conducting chemical, physical and microbiological analysis.

Results of laboratory soil analyses indicated that an area of approximately 50 feet in diameter had been impacted by the smudge pot oil release. The vertical extent of the impacted soil was limited to a depth of approximately 80 feet bgs, immediately beneath the former tank area. Groundwater was encountered in one boring at a depth of 133 feet bgs. Groundwater samples collected from the borehole were analyzed for TPH and aromatic hydrocarbons. The laboratory

California Environmental Protection Agency

results indicated that groundwater was unaffected by the smudge pot oil release. The results of microbiological tests indicated that the site was suitable for bioremediation.

In April 1996, a bioventing remediation work plan was submitted by Clayton. The bioventing remediation system consisted of one vapor extraction well at the middle of the hydrocarbon impacted area and utilization of two existing vapor extraction wells that had been in place since 1993. The new well, which was slotted between 5 to 30 feet bgs, was used primarily as a vent well to allow air flow through the shallow impacted zones. Quarterly vapor samples were obtained from each well and the inlet and outlet to the treatment equipment. Samples were analyzed for volatile fuel hydrocarbons and aromatic hydrocarbons. The samples were also analyzed for fixed gases to determine the concentrations of oxygen, carbon dioxide, nitrogen, carbon monoxide and methane. The effectiveness of the bioventing system was monitored quarterly to ensure satisfactory system performance. In addition, it was agreed that after one year of operation, a boring would be drilled in the impacted area and soil samples would be collected for analysis. Based upon the nature of the target contaminants, SCE proposed a clean-up goal of 10,000 to 15,000 mg/kg of TPH.

Clayton, at the direction of SCE, operated an extraction/injection remediation system and performed required system monitoring for over 2 years at the Chase Substation facility. Since the initial startup on August 14, 1996, the system was operated in an extraction mode for 46 weeks. At the direction of SCE, and with Board staff approval, the system was then reconfigured to implement an injection technology, which started on September 5, 1997. The injection system was operated for a total of 44 weeks, ending August 3, 1998.

In February 1998, a confirmation soil boring was advanced and confirmation samples were collected. The analytical results of the confirmation boring samples indicated that the site remediation objectives had been met and that reduction in the concentration of hydrocarbons had been achieved. Subsequent discussions between SCE and Board staff resulted in an agreement to remove the remaining impacted soil (TPH concentrations above 2,000 mg/kg) to a depth of 10 feet bgs.

On August 11, 1998, soil excavation at the Chase Substation took place and analysis of the excavated soil was conducted on-site, utilizing a State certified mobile laboratory. Board staff was present during excavation and soil sample analysis. Analyses of the soil samples were conducted during and upon completion of excavation activities, with samples collected from the excavation sides and bottom. Each sample was analyzed for TPH, using EPA Method 8015, modified for gasoline and diesel. No detectable TPH-diesel was found in 21 samples. One sample, collected from the petroleum-impacted east sidewall (approximately 7 feet bgs, along western shoulder of the Compton Avenue), contained TPH-diesel at a concentration of 448 mg/kg.

Based on the analytical results, Board staff indicated that since the TPH-diesel concentrations were below the 2,000 mg/kg target level, further excavation was not necessary, and the excavation, which measured approximately 45 feet long, 25 feet wide and 10 feet deep, could

Subject: UST Sample Analytical Review

Good Morning Sharon,

Attached to this email you will find the UST sample analytical results taken from Corona AMPM, FA0043389. A single soil sample was taken from the existing manifold vent riser due to the vent lines being relocated. Results were all ND. Please let me know if you require any additional paperwork.

Thank you,

Kathleen Estrada

Arrived onsite and met with Jeff Lee of Environ Phase Consulting Co. and Vasquez Maintenance Co. to witness the soil sampling of the existing manifold vent riser at the abovementioned located. A single soil sample was taken the center of the vent riser between the center vent pipes (four vent lines total). The soil sample was taken 2 Ft. below the vent piping into native soil via a hand agar. The soil sample was place into a stainless steel metal sleeve, evidence taped, and placed on ice. A Sample Request form and Laboratory Analyses for Samples Collected at UST Sites form were provided to Jeff Lee. Sample will be ran for 8015 (GRO), 8260B +oxygenates, and SW-846 Methods with analytical reports sent to this Department for review.

Dear Mr. Lukowski:

The Riverside County Department of Environmental Health, Hazardous Materials Management Division (HMMD), has received and reviewed the *Site Closure Report*, (Reynolds Group, April 3, 2005) for the above referenced location. Based on the information presented in the report, no further action is required at this time.

Be advised that this letter does not relieve you of any responsibilities mandated under the California Health & Safety Code if additional or previously unidentified contamination is discovered at this same location.

If you have any questions regarding this matter, please contact Kelly Winters myself at (951) 358-5055.

Sincerely,

Michael Shetler
Supervising Hazardous Materials Management Specialist
Hazardous Materials Management Division

NARRATIVE REPORT:

0900 hrs.

I received information from Hazardous Materials Management Specialist Bruce Bailey regarding soil contamination at a former Southern California Edison Facility in Corona. Specialist Bailey had been driving by the site and noticed what appeared to be stained soil. The site is currently undergoing development and recent grading activities have exposed what appears to be soil contamination. Specialist Bailey set up a meeting with the developer (Silver Creek Properties) to discuss the soil cleanup.

3/3/05

1000 hrs.

Specialist Bailey and I met with representatives from Silver Creek Properties and the consulting firm The Reynolds Group at the subject site. It was agreed that previous work done at the site may have missed some of the soil contamination and that additional assessment and remediation work would be necessary.

Details of the clean up and assessment are presented in the Site Closure Report prepared by the Reynolds group dated April 3, 2005. A copy of the "no further action letter" prepared by Riverside County is attached to this ERCI. No PCBs were detected during the assessment by the Reynolds Group.

No further action required. Case Closed.

**SUBJECT: REQUEST FOR 'NO FURTHER ACTION'
WITH RESULTS OF LATEST ASSESSMENT ACTIVITIES**

Dear Mr. Winters:

Thank you for working with us to expedite this project. Your professionalism and responsiveness have been refreshing to us. This latest round of work was triggered by the January 3, 2005 discovery of stained soils with a hydrocarbon odor and the subsequent discovery of a Southern California Edison (SCE) transformer station. Year to date assessment has included excavation of the impacted soils, health risk exposure assessment of the resultant stockpile and excavation, and a polychlorinated biphenyl (PCB) screening of the SCE transformer station. As outlined in the March 29, 2005 meeting, we believe that the site has been adequately assessed, the human health risk exposure pathways have been evaluated, and there no health risk concerns to proceeding with the proposed construction activities and land use.

As we concluded in our March 28, 2005 meeting in your office, we are requesting that you:

1. Issue a 'no further action letter' related to the smudge pot oil and PCB issues that have been discovered, assessed and evaluated for the Site so that construction development can be completed;
2. Permit the placement of the stockpiled soil from the February 2 through 4, 2005 excavation activities below asphalted parking areas onsite; and,
3. Permit the backfill of the February 2 through 4, 2005, open excavation with clean fill dirt.

BACKGROUND

The detailed case history information package and a workplan were transmitted to you under a cover letter dated March 11, 2005. The package included correspondence and reports related to the work.

The subject site (the Site) is a commercially zoned vacant lot located at the northwest corner of the intersection of Ontario Avenue and State Street in the City of Corona. See the attached Figure 1 – Site Location Map. The Site includes assessors parcel number (APN) 227-020-001, 15, 278-060-023 and covers approximately six (6) acres. The area of investigation is a smaller approximately one (1) acre strip along the north side of Ontario Avenue, nearly midway between State Street and the northbound entrance to the Interstate 15 freeway. A review of historical uses in a July 10, 2003 *Phase I Environmental Site Assessment* by Pacific Southwest Group states that sometime between 1962 and 1970 the Site was used for agricultural purposes and remained mostly vacant, except for a farm house along the southern perimeter, until late 2002.

In early December 2002, rough grading operations revealed a greenish, discolored soil stain with a petroleum odor along the southern perimeter of the Site. Subsequent investigations and remediation were conducted under the approval of the California Regional Water Quality Control Board - Santa Ana Region (SARWQCB) and case manager Ray Akhtarshad. In March and May 2003, Alta EM, Inc. advanced a total of twelve borings, B1 through B12, at the Site. See Figure 2 – Plot Plan with Sample Locations. The following major conclusions were derived from the subsurface investigation:

- The detected petroleum was determined to be smudge pot oil.
- No significant concentrations of BTEX or methyl tertiary butyl ether (MTBE) were reported.
- The maximum vertical extent of impacted soil was adequately assessed with no detections of TPH and BTEX below 40 ft bgs onsite and below 75 ft bgs offsite.
- No groundwater was encountered to a maximum depth of 105 ft bgs. Additionally, hydrogeological research indicated a low potential for an alluvial groundwater zone beneath the Site.
- There are no water supply wells listed with the City of Corona and Western Municipal Water District within an approximate one-mile radius of the Site.

On August 26 and 27, 2003, Alta EM, Inc. oversaw the removal of soils in an approximate 60 ft by 60 ft excavation to 10 ft bgs. Soils were excavated to 10 ft bgs as agreed upon with the SARWQCB as the minimum necessary to be protective of public health and future site occupants. The cleanup goals agreed upon with the SARWQCB and applicable to the lateral removal of impacted soil are described in the table below:

Table: Alta EM, Inc. Cleanup Goals for August 2003 Excavation

COMPOUND	CLEANUP GOAL	COMMENT
TPH (C12 - C14)	2,000 mg/kg	Diesel range C ₁₄ - C ₂₄ (i.e. smudge pot oil)
Benzene	0.25 mg/kg	None detected in excess of this cleanup goal.
Toluene, Ethylbenzene, and Total Xylenes	1.0 mg/kg	
MTBE	0.25 mg/kg	None detected.

Following soil removal, sampling and request for closure, Ray Akhtarshad of the SARWQCB issued a site closure letter dated November 25, 2003. No case file number was referenced in the case closure letter.

2005 YEAR TO DATE ACTIVITIES

SURVEYING OF SITE

The area of investigation was surveyed on March 1, 2005. The location of Alta EM's 2003 excavation work was located in relation to the recent 2005 excavation and sampling activities. In addition, the former SCE transformer station was located. A January 29, 1995 historical aerial photo was ordered at 1" to 50' scale to accurately place the former SCE transformer station within the site context. Also, prior to the March 21, 2005 PCB soil screening, the former SCE conduits, guide wire ground support, and adjacent tree stump were located. The location of the former SCE conduits, guide wire ground support, and adjacent tree stump all are shown in the attached figures.

EXCAVATION - February 2 to 4, 2005

During grading operations at the Site on January 3, 2005 stained soils with a hydrocarbon odor were encountered. A month later, on February 2 thru 4, 2005 soils were excavated in two locations adjacent west of the formerly impacted soil region assessed by Alta EM, Inc. The resulting excavation (Excavation #1) measured approximately 58 feet long, 28 feet wide, and 15 feet in depth with respect to the surface elevation at the time the excavation commenced. A second smaller excavation (Excavation #2) was advanced

where the grading foreman indicated that "contamination" was encountered. Excavation #2 was half-moon shaped and measured 17 feet long, eight feet wide at the widest point, and four feet deep.

At the end of the excavation, soil samples were collected at the bottom of Excavation #1 and Excavation #2 and labeled "SP-1" through "SP-10" and "AP-1" and "AP-2", respectively. See the February 2 through 4, 2005 soil sample locations shown in Figure 2 - Plot Plan with Sample Locations.

All of the samples collected in Excavation #1 contained Fuel Chain Hydrocarbons in the C13-C22 range except for the two samples collected in the northwest (SP-9) and northeast corners (SP-2). The concentrations ranged from non-detect in the two northwest corner samples to 4,729 milligrams per kilogram (MG/KG, parts per million or ppm) of C13-C22 range petroleum hydrocarbons. Additional analyses for Volatile Organic Compounds yielded all non-detect results.

The two highest result samples were further analyzed by EPA Method 8270 for semi-Volatile components. Both samples, SP-3 and SP-7, showed detections of naphthalene, methylnaphthalene, phenanthrene, and pyrene. The analytical results were similar with the slightly higher concentrations in sample SP-3 as 6,720 ug/kg, 9,115 ug/kg, 5,432 ug/kg, and 3,100 ug/kg, respectively. All of the 2005 year to date soil sample results shown in Table 1 - Soil Sample Results and Table 2 - Volatile Organic Compound Soil Sample Results.

STOCKPILED SOIL SAMPLING - March 1, 2005

The soils from Excavation #1 and Excavation #2 were stockpiled onsite. On March 1, 2005, the stockpiled samples were analyzed. A statistically valid number of soil samples were collected using a systematic (grid-based) sampling plan. To sample the stockpile, we hand-augered small borings to approximately four (4) feet into the stockpile and collected a soil sample using a slide-hammer advance a brass soil sample sleeve. Then, the stockpiled soil samples were labeled "Pile-1" through "Pile -14".

The stockpile soil samples were analyzed for EPA Method 8015 carbon chain, EPA Method 8260B full scan for VOC's, EPA Method 8270C SVOC for semi-volatile compounds, and EPA Method 8082 for PCBs. The stockpiled soil samples are shown in the attached Table 3A - Stockpiled Soil Sample Results and Table 3B - Volatile Stockpiled Soil Sample Results. All of the analytes in the stockpiled soil results were below the allowable leave-in-place concentrations agreed upon for the November 25, 2003 closure by the SARWQCB. No PCB's were detected.

Subsequently, the stockpiled soils were sampled for volatile organic compounds by collecting ten (10) soil vapor samples labeled, "SV-1" through "SV-10", and analyzing

them using EPA Method 8260B for VOCs. The results were all non-detect as shown in the attached Table 4 – Stockpiled Soil Vapor Sample Results.

The February 2 thru 4, 2005 soil sample and excavation locations were surveyed on March 1, 2005 in order to orient the 2005 year-to-date activities with historic and future site activities.

SOIL VAPOR SURVEY – March 7, 2005

Anticipating that this case would be driven by health risk concerns, and to create a case for leaving contaminated soils in-place, The Reynolds Group performed a statistically valid soil gas survey in order to use the results for potential health risk analyses. The purpose of the work was to assess the potential soil vapor intrusion pathway to future site occupants. The soil vapor survey was conducted according to the most current, stringent Department of Toxic Substances Control (DTSC) guidelines by H&P Mobile Geochemistry, a San Diego based soil gas sampling and analysis firm. The soil gas sampling was performed on March 7, 2005.

The soil vapor survey was conducted from a statistically valid number of sample points inside and around the proposed Starbucks pad. The proposed Starbucks is the only proposed building in the vicinity of the impacted soils. A total of sixteen (16) soil vapor sample points were set in a systematic (grid-based) sampling plan. In-situ soil vapor samples were extracted at 5 and 15 ft bgs at all locations except locations SG-6 and SG-14 due to the excavation depth and refusal, respectively. See the sample locations shown in the attached Figure 2.

The in-situ soil vapor samples were analyzed by EPA Method 8260B for vapor compounds, including Naphthalene. See the results in Table 5 – Soil Vapor Survey Sample Results.

Our expectation was that we would confirm that naphthalene was at acceptable health risk levels. Naphthalene was detected in two soil matrix samples collected during the February 2 through 4, 2005 excavation and sampling activities. Naphthalene is a semi-volatile compounds currently listed as a compound of concern for vapor intrusion in the Office of Environmental Health Hazard Assessment (OEHHA) *Human-Exposure-Based Screening Numbers Developed to Aid Estimation of Cleanup Costs for Contaminated Soil* dated November 2004 and revised January 2005.

To our surprise, no naphthalene was detected, but benzene was detected in three of the sixteen samples. According to the soil gas screening numbers provided in the revised January 2005 OEHHA *Human-Exposure-Based Screening Numbers Developed to Aid Estimation of Cleanup Costs for Contaminated Soil*, benzene might be a potential concern. Benzene concentrations immediately beneath the proposed Starbucks pad were detected in two of the twelve samples at 1.1 and 1.5 ug/L. Benzene was also detected

over 30 ft south from the proposed Starbucks slab and at 15 ft bgs in sample SG-12. As described in the "Discussion" section of this report, further analysis of the benzene concentrations was performed using the Johnson and Ettinger Model.

PCB SOIL SCREENING – March 21, 2005

On March 1, 2005, we were alerted in a phone call from Bruce Bailey, Riverside County Department of Environmental Health, that polychlorobiphenols (PCBs) potentially may have leaked from a 1997 explosion at a former Southern California Edison (SCE) Chase No. 2 Substation ("SCE Substation"). As a result of a March 9, 2005 meeting onsite with representatives of the County of Riverside and the Santa Ana Regional Water Quality Control Board, a decision was made to accurately determine the location of the former SCE substation and assess the area for PCB's.

The exact location of the former SCE transformer station was determined by:

- A January 29, 1995 historical aerial photo was ordered at 1" to 50' scale and received on March 5, 2005 to accurately place the former SCE Substation within the site context.
- A review of an *Environmental Assessment: Chase No. 2 Substation Corona, California* by Environmental Engineers dated April 8, 2002 and May 2, 1997 was performed; and,
- The former SCE conduits, guide wire ground support, and adjacent tree stump were located. These all are shown in the attached figures.

Initial PCB Sampling

Initially, on March 1, 2005, one soil sample was collected from the vicinity of former sample "SP-7" within Excavation #1. The soil sample was collected from the sidewall above former soil sample SP-7 and approximately 10 feet below ground surface (ft bgs). The soil sample was labeled "SP7 PCB-10" and analyzed for EPA Method 8015 carbon chain, EPA Method 8260B full scan for volatile organic compounds (VOC's), EPA Method 8270c for semi-volatile VOCs (SVOCs), and EPA Method 8082 for PCBs.

The results showed concentrations of 193,000 ug/kg for carbon chain C₁₃ to C₂₂, non-detect for all VOC's, and non-detect for PCBs. See all of the soil sample results in Table 1 and Table 2 attached.

SCE Transformer Station PCB Sampling

As described in the "Survey of Site" section above, the former SCE Substation was determined to exist east of the Alta EM 2003 excavation as shown in the attached figures. About two to three feet of fill lie above the former ground level of the SCE Substation. As proposed in our March workplan, on March 21, 2005, we sampled the soils from nine

locations arranged in a center aligned systematic grid sampling design and analyzed by EPA Method 8082 for PCBs. See the attached Figure 2 – Plot Plan with Sample Locations. The soil samples were collected from 3 ft bgs using a hydraulic push probe rig. This approximated the ground surface to a foot below the former SCE transformer station. No PCB's were detected. The results are listed in the attached Table 6 – Summary of March 21, 2005 PCB Soil Analytical Results.

ADDITIONAL SITE ASSESSMENT – March 21, 2005

On March 21, 2005, we advanced probes SP11 through SP14 approximately 15 ft laterally outside the excavation to delineate the lateral and vertical extent of naphthalene exceeding the USEPA Region 9 PRG of 4,200 ug/kg. Specifically, previous borings SP3 and SP7 showed concentrations of 4,994 ug/kg and 6,720 ug/kg, respectively. The soil borings were advanced to a maximum depth of 13.5 ft below the proposed Starbucks (20 ft below the existing grade). Note, all depths are referenced to the depth below the proposed Starbucks slab finished floor elevation, since this building contains the sensitive receptors being evaluated. This additional assessment was given verbal approval by Kelly Winters of the Riverside County Department of Environmental Health on March 18, 2005. See the probe locations shown on the attached Figure 3 – Plot Plan with Analytical Results.

Soil samples from this investigation were analyzed by EPA Methods 8015 full scan for TPH, 8260B full scan for VOC's, and 8270B for semi-VOC's. The results are shown in Table 1 – Soil Analytical Results and Table 2 – Semi-Volatile Soil Sample Results. The soil analytical results for this additional March 21, 2005 assessment showed no detections of SVOC's above laboratory reporting limits and no detections of VOC's above the most conservative USEPA Region 9 residential PRG's. Note, there is no US EPA Region 9 PRG for TPH.

DISCUSSION

The potential exposure pathways from subsurface contaminated soil to sensitive receptors have been evaluated and determined to not pose a health risk. Direct physical contact with contaminated soil and inhalation via vapor intrusion from soil impacted with volatile compounds were the two potential pathways. There are no other pathways. The subject site is zoned for commercial land use, and the health risk evaluations were conducted with the understanding of the commercial/industrial land use. However, the attached analytical result tables show the residential and industrial/commercial US EPA Region 9 PRG's at the request of Kelly Winters, Riverside County Department of Environmental Health. The following is an analysis of the exposure pathways.

Direct Exposure Pathway (Physical Contact)

While two samples results, SP3 and SP7, show naphthalene in excess of the "industrial/commercial" PRG of 4,200 ug/kg (California modified), they are both below the shallow soils depth of 10 ft bgs necessary to protect public health and future site occupants. California EPA defines shallow soils as those soils above 10 ft bgs and which "may be exposed during future redevelopment activities" (Cal EPA 1996). The February 2 through 4, 2005 excavation extended beyond the minimum ten feet of depth necessary to be protective of public health and future site occupants. The March 21, 2005 additional subsurface assessment confirmed that the naphthalene impacted soils in the vicinity of former probes SP3 and SP7 are laterally limited to within 15 ft of their detection, since no semi-VOC's and very low VOC were detected in the additional investigation. Furthermore, the stockpiled soil has been determined to be below the November 25, 2003 SARWQCB case closure cleanup goals and the conservative US EPA Region 9 residential PRGs. Soil gas results over the site area and in the stockpiled soils were within allowable ranges. Finally, no residual semi-volatile (naphthalene, methyl-naphthalene, phenanthrene, and pyrene) concentrations were detected in any soil sample from the stockpile. No PCB's were ever detected in any soil sample.

In the Recommendation section below, we propose to backfill the excavation with clean fill material since it will be in close proximity to the proposed Starbucks and place the stockpiled soil under the asphalt covered parking areas.

The entirety of the site, except for small landscape areas will be covered with asphalt and/or concrete. Physical contact with contaminated soils will not be possible.

Soil Vapor Intrusion Pathway (Health Risk Analysis)

Results from the soil gas survey performed to DTSC standards in the vicinity of the proposed Starbucks showed three benzene detections that were above the OEHHA soil gas screening number for benzene, which are 0.0852 ug/L (residential) and 0.280 ug/L (commercial). Soil gas sample location SG-12 is located over 30 ft away from the proposed Starbucks concrete pad. Sample SG-12 contained 7 ug/L of benzene which was detected at 15 ft bgs. The depth and distance of the SG-12 benzene concentration from the proposed Starbucks slab is not as significant (due to natural attenuation and biodegradation factors) as the data collected in the immediate vicinity of the proposed Starbucks slab. Also, soil gas sample SG-7 is located approximately 10 ft from the proposed Starbucks concrete slab and between sample SG-12 and the proposed Starbucks slab. Soil gas sample SG-7 showed no detections of any analyte at 5 and 15 ft bgs. Because three benzene detections that were above the tier I approach (ie. OEHHA soil gas screening numbers), we proceeded with a tier II approach of inputting the soil gas data into the current, DTSC, advanced, soil gas Johnson and Ettinger Models (J&E Model) using some site specific parameters. The soil gas samples in the immediate

vicinity of the slab and considered significant for vapor intrusion modeling purposes include SG-6 through SG-9 and SG13 through SG-16.

The 95% Upper Confidence Limit (UCL) value of the reported data was used to model the vapor intrusion using the J&E Model. The overall risk and hazard quotient from volatile organic compounds was calculated as **8.86e-7** and **0.0017**. The risk is less than one in a million ($1e-6$) and the hazard quotient is below 1.0, signifying that there is no cancer or non-cancerous risk from the impacted soil to the exposed populations. Please see the model input values and results attached.

COMPOUND	95% UCL MODELED CONC ($\mu\text{g}/\text{m}^3$)	Risk	Hazard Quotient	Risk Model Used
Benzene	153	8.32E-07	0.001	J&E Model
Toluene	327	NA	5.57E-04	J&E Model
Ethylbenzene	287	5.27E-08	5.59E-05	J&E Model
Xylene	288	Not Applicable	1.71E-04	J&E Model
TOTALS:		8.86E-07	0.0017	

Also, the soils stockpiled from the February 2 through 4, 2005 removal have been screened with a soil gas survey for volatile compounds with results showing non-detect. The stockpiled soil does not serve as a source for volatile organic compounds and the vapor intrusion pathway.

CONCLUSIONS

The assessment and work performed to date concludes the following:

- The detected petroleum was determined to be in the C_{13} - C_{22} range.
- The assessment has been completed.
- No significant concentrations of BTEX were reported and no methyl tertiary butyl ether (MTBE) or other oxygenates of gasoline have ever been detected.
- The maximum vertical extent of petroleum hydrocarbon impacted soil has been adequately assessed. Previous investigations determined that the maximum extent of petroleum hydrocarbon impacted soils extended to 40 ft bgs within the site and to 70 ft bgs off the site.

- No groundwater was encountered to a maximum depth of 105 ft bgs. There is a clean zone of soil above the groundwater table which we presume to be deeper than 105 feet.
- The maximum leave-in-place concentrations are listed in the attached Table 7 – Maximum Leave in Place Sample Results with a comparison to the US EPA Region 9 residential and commercial PRGs. These concentrations indicate the maximum concentrations of chemicals that are left in place in the soils at the site.
- The leave-in-place concentrations have been evaluated for site specific health risk exposure pathways and are considered to be safe given the development proposed.

RECOMMENDATIONS

Based on discussions in our meeting on March 28, 2005, we advised our client to transfer the stockpiled soils to beneath asphalted parking areas and backfill excavations with clean soil. We request that the Riverside County Department of Environmental Health to issue a 'no further action' letter on this site.

We will send a final soil disposition map showing the location of the stockpiled soil in relation to the development with a cover letter when this action is satisfactorily completed.

Newport Beach, CA 92663

SITE CLOSURE FOR THE PENINSULA RETAIL DEVELOPMENT PROPERTY, NORTHWEST CORNER OF ONTARIO AVENUE AND STATE STREET, CORONA

Dear Mr. Ewing:

We have reviewed your October 6, 2003 submittal of the Soil Remediation Report (report) for the Peninsula Retail Development property located at the northwest corner of Ontario Avenue and State Street within the City of Corona, Riverside County. This report was prepared and submitted by your consultant, ALTA EM, Inc. The report describes the following activities that were implemented to remediate the impacts of the smudge pot oil release at the site:

1. The impacted soils with total petroleum hydrocarbons (TPH) in excess of 2,000 milligrams per kilogram were excavated to a depth of 10 feet below grade;
2. The excavated area was surveyed and mapped. This map will remain with site records for future reference;
3. Verification samples were collected from the side walls of the excavated area and analyzed for TPH (C10 – C22);
4. The excavation area was backfilled with clean soils and graded to promote positive drainage from the area; and
5. The excavated soils were transported to a permitted recycling/disposal facility, Thermal Remediation Solution, in Azusa.

Based upon the information provided in the closure report and the low concentrations of TPH in the verification samples, we have determined that the site has been sufficiently cleaned up to mitigate any potential impacts to water quality, and therefore, no further action is necessary. Please be advised that this determination of no further action does not relieve you of your responsibility to comply with any rules and regulations set forth by other agencies.

California Environmental Protection Agency

RE: Underground Storage Tank (UST) Cleanup at the Shell Station located at 1205 Magnolia Avenue in Corona, California

Dear Responsible Parties,

This letter confirms the completion of a site investigation and corrective action for the underground storage tank(s) located at the above described location. Thank you for your cooperation throughout this investigation. Your willingness and promptness in responding to our inquires concerning the underground storage tank(s) are greatly appreciated.

Based on the information in the above-referenced file, and with the provision that the information provided to this agency was accurate and representative of site conditions, this agency finds that the site investigation and corrective action carried out at your underground storage tank(s) site is in compliance with the requirements of subdivisions (a) and (b) of Section 25296.10 of the Health and Safety Code and with corrective action regulations adopted pursuant to Section 25299.3 of the Health and Safety Code and that no further action related to the petroleum release(s) at the site is required.

This notice is issued pursuant to subdivision (g) of Section 25296.10 of the Health and Safety Code. If you have any questions regarding this matter, please contact Sharon Boltinghouse at (951) 955-8982.

Sincerely,

Steve Van Stockum
Director, Environmental Health

Signature: <i>Sharon Boltinghouse</i>	Date: 5-11-09

VI. RWQCB Notification

Date Submitted To RWQCB:	Date Signed By RWQCB:
RWQCB Staff Assigned To Case: CAB	11/21/09
RWQCB Response: <i>Consents w/ Closure</i>	
Signature: <i>Kenneth Williams</i>	Title: <i>Chief, UST Section</i>

VII. Additional Comments, Data, Etc.

Assessment and Remediation:

1991 to 1992 – A leak in the flex connector at the turbine was discovered during UST system testing. Three soil borings were drilled to assess soil conditions. Results indicated that soils were impacted with petroleum hydrocarbons and the site was entered into the Local Oversight Program.

1993 to 2002 – Seven additional borings and four groundwater (GW) monitoring wells were completed. GW was encountered at 105 ft below grade. Initial GW samples detected MTBE at concentrations of 320 ppb in MW-1 and 53 ppb in MW-3.

2002 – The product piping and dispensers were upgraded. TPHg, TBA and MTBE were detected in soil samples collected under the piping. The highest detections were MTBE (3.5 ppm).

2004 to 2006 – Two soil borings and two soil vapor extraction (SVE) wells were installed. MTBE was detected to a maximum depth of 100 feet below grade. Six additional single- and multi-completion SVE wells were installed and a SVE pilot test was completed. Assessment data indicated that soil in the vicinity of the southwest portion of the UST zone and northwestern dispenser island were impacted by petroleum hydrocarbons. Testing concluded that SVE was a viable remedial technology for this site.

11/14/06 to 8/9/07 – A SVE system was operated using eight extraction wells. A total of 374.6 lb (~52 gal) of hydrocarbons were removed during SVE operations. Petroleum hydrocarbon and oxygenate recovery rates ranged from 0.01 to 0.46 lb/hr prior to SVE shut-down.

September 2007 – SVE rebound testing was conducted. 13.5 lb of hydrocarbons were removed during the 172-hr test at a removal rate of 0.07 lb/hr (~1.7 gal/day). Vapor sampling data showed a spike in vapor concentrations (maximum 3400 ppmV TPHg) at the beginning of the test with a rapid decline to 400 ppmV after six hours then concentrations dropped below 30 ppmV after one day of operation.

December 2007 – Three confirmation soil borings were drilled to 115 feet below ground surface. Soil sample results indicate that remedial efforts were effective at reducing impacts to the soil. Maximum concentrations detected: 6.4 ppm TPHg (CB-3@32 ft), 2.7 ppb xylenes (CB-1@22 ft), 45 ppb MTBE (CB-3@87 ft), 38 ppb acetone (CB-2@5 ft), 26 ppb 1,2,4-TMB (CB-3@32 ft), 3.5 ppb 1,3,5-TMB (CB-3@32 ft), 770 ppb Naphthalene (CB-3@32 ft). Based on the site data, the consultant concludes that SVE has effectively removed hydrocarbon impacts to the site.

CASE CLOSURE SUMMARY
LEAKING UNDERGROUND FUEL STORAGE TANK PROGRAM

SITE NAME: Shell Magnolia Ave

SITE NO: 91850

Groundwater (GW) Monitoring:

Quarterly GW monitoring has been conducted since September 1999. Water levels have dropped approximately 10 feet during this time. Depth to GW has ranged from 105 feet bgs to 117 feet bgs and is currently at 116 feet bgs. Groundwater flow has varied from southwest to northwest, but has been primarily southwesterly. Groundwater samples have been below detection limits for TPHg, BTXE, and fuel oxygenates for approximately two years, except MTBE which was detected three times (highest 13 ppb). MTBE was not detected in Q4-08. Perchlorate has been detected in the GW (maximum 17 ppb, currently 11 ppb). Maximum and current concentrations listed in Section III. One year of post-remediation monitoring has taken place.

Residual Impacts: 0.21 lb hydrocarbons mass remains in the approximate 500 cu yds of impacted soils with an average TPHg concentration of 3.7 ppm.

Subsurface Soil types: Silty gravel, sandy silt, and fine- to medium-grained gravelly sand from ground surface to approx 125 ft bgs.

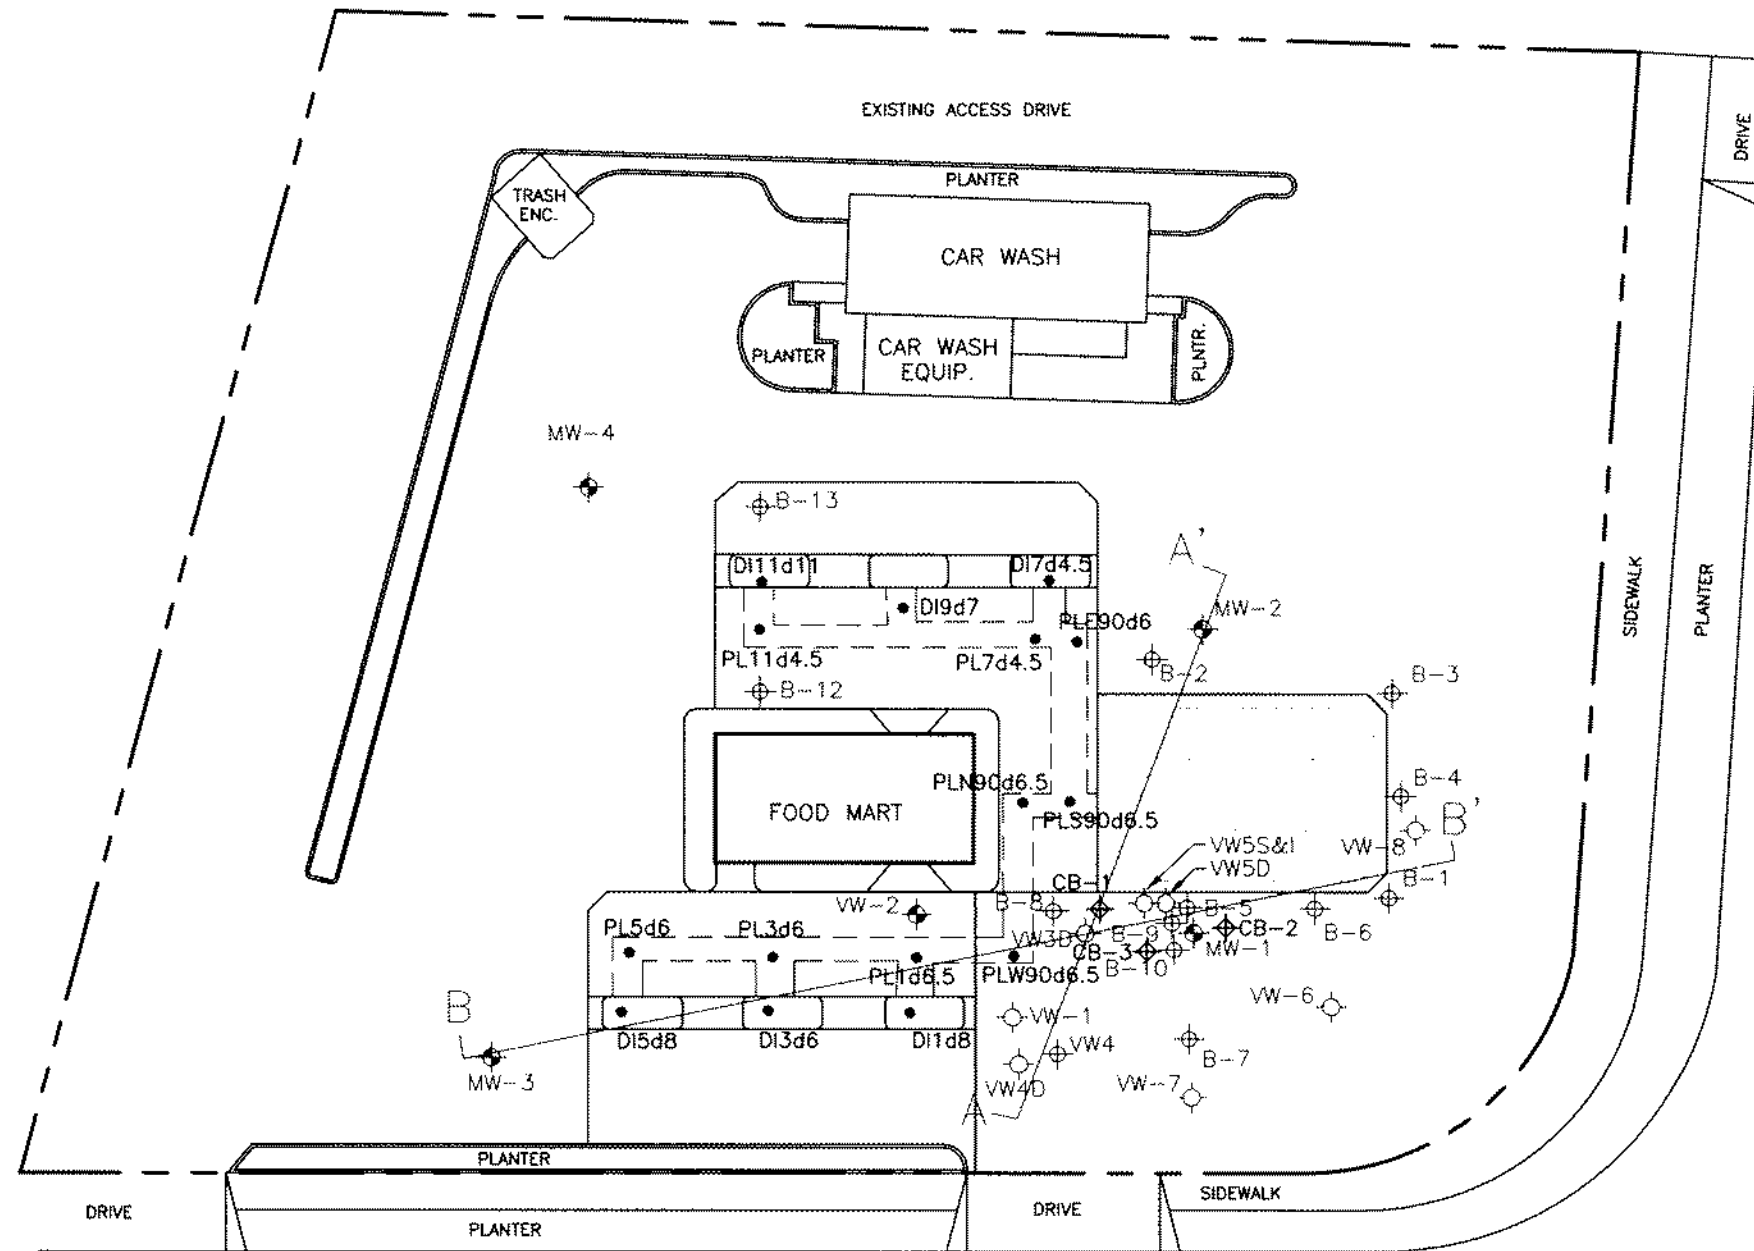

Depth to GW: 105 ft bgs to 116 ft bgs **Current Depth:** 115 ft bgs

GW Flow Direction: northwest to southwest (predominantly to southwest)

Sensitive Receptors: Closest water well ~1100 ft to north of site

Other information: UST system currently installed and operating at the site.

NOTE: This closure summary does not include all of the data for this cleanup. It was prepared by the Riverside County DEH for the purpose of providing a brief summary for case closure evaluation. The Site Closure Request Report (Wayne Perry, Inc., December 4, 2008) and all other environmental reports pertaining to this cleanup site as well as the DEH Local Oversight Program case file should be reviewed in their entirety to obtain further details regarding this cleanup.

MAXIMUM DOCUMENTED CONTAMINANT CONCENTRATIONS – Before & After Cleanup						
CONTAMINANT	SOIL ppm				GROUNDWATER ppb	
	BEFORE	DEPTH	AFTER	DEPTH	BEFORE	AFTER
TPH (GAS)						
TPH (DIESEL)	23,621	15' bgs	all initial concentrations are still in place		9,300	1,500
TRPH (418.1)						
BENZENE	ND	all			ND	ND
TOLUENE	ND	all			ND	ND
XYLENE	ND	all			ND	ND
ETHYLBENZENE	ND	all			ND	ND
MTBE	.0059	20' bgs			28	ND
PNA's (fluorene)	NA	NA			14	NA

COMMENTS (soil types, depth of remediation, etc.): Sand, silty sand and gravelly sand to approximately 41' -54' bgs and silty clay to at least 60' bgs. The groundwater appears to be perched upon the clayey layer.

VII. Additional Comments, Data, Etc.

On May 12, 1997 nine probe holes were advanced in the vicinity of two large diesel USTs as part of the abandonment-in-place process. An additional twelve vertical probe holes were advanced along the product lines. The samples revealed some elevated TPH-d concentrations (up to 4,967 ppm), but BTEX was not detected in any of the samples collected. On September 30, 1997 two more bore holes were advanced to further the assessment, but they encountered refusal at approximately 22' bgs. From October 7, 1997 to October 17, 1997 five additional borings were advanced to complete the delineation of the soil plume.

The consultants contend that the source of the diesel contamination is likely the 20,000 gallon diesel tank. The plume containing 1,000 ppm or greater TPH-d extends over an area of approximately 3,000 square feet within the capillary fringe above the water table. Impacted soil is confined vertically to gravelly sands above a silty clay layer which was encountered at depths ranging from 41 to 64' bgs. The consultant estimates that the volume of impacted soil is approximately 1,200 cubic yards.

Three groundwater monitoring wells were then installed on May 19 and May 20, 1998. Four consecutive quarters of groundwater monitoring and sampling have been conducted. BTEX has never been detected in the soil or the groundwater at the site. The TPH-d and MTBE levels present in groundwater have decreased and the consultant is requesting no further action.

PROPERTY KNOWN AS CORONA CROSSROADS, SHERBORN STREET, CORONA, CA

Dear Ms. McKeith:

Board staff has reviewed the following report (the "Report") concerning the property (the "Property") noted above:

"Report, Phase I Environmental Site Assessment Corona Crossroads, 76 Acre Site and 45 Acre Site on Sherborn Street, Corona, California, dated January 22, 1999, prepared by Dames & Moore, for the Magellan Corporation"

We understand that Magellan Acquisitions, LLC, and Sunbelt Holdings, LLC, collectively as Purchaser, are considering the acquisition of the Property from its current owner, TBC Corona, Inc. The Property is located adjacent to the former Corona Sanitary Landfill and other industrial sites.

Information contained in the Report indicates that the 76-acre site has historically been undeveloped property, and that there were no activities conducted that would have resulted in significant impacts to groundwater. Also, there are two groundwater monitoring wells located on the upgradient portion of the 76-acre site. These wells were installed by the County of Riverside in conjunction with ongoing monitoring activities associated with the Corona Sanitary Landfill. Although historical monitoring has occasionally detected some metals and halogenated VOCs at low concentrations in these two wells, no metals or halogenated VOCs have been detected since 1995. Contaminants previously detected in these two wells were not present in concentrations of concern. Based on information currently available to Board staff, we have no reason to believe that contaminants have adversely impacted groundwater underlying the 76-acre site. We concur with the Report's recommendation that no further on-site investigation of the 76-acre site is necessary.

Information contained in the Report indicates that the 45-acre site has historically been undeveloped land. However, the site has been used as a nursery, a building materials center, a storage yard for concrete building products, and for heavy equipment and trailer storage. The report recommends removal of debris piles and stained soil. Also, an upgradient groundwater monitoring well for the landfill is located adjacent to, and immediately downgradient of, the site. This well has contained low concentrations of halogenated VOCs. Another monitoring well located downgradient of the landfill, has also shown low concentrations of halogenated VOCs. It appears that the source of these halogenated VOCs is the landfill.

California Environmental Protection Agency

If contaminants from upgradient or crossgradient sources were to impact groundwater underlying the Property, please be aware that, in general, the Board does not pursue enforcement actions against a property owner whose land overlies contaminated groundwater if that contamination is solely the result of migration of groundwater contaminants from an off-site source or sources. Accordingly, the Board would generally not name the current and future owners of the Property as dischargers with respect to groundwater contamination from off-site sources. An exception to this would occur should the owner of the Property refuse to provide reasonable access to upgradient or crossgradient dischargers attempting to investigate and clean up off-site groundwater contamination. We concur with the recommendations contained in the Report, and find that no further action for investigation of soil or groundwater at the Property is necessary.

In you have any questions please contact Robert L. Holub, Chief of our SLIC Section, at (909) 782-3298.

Sincerely,

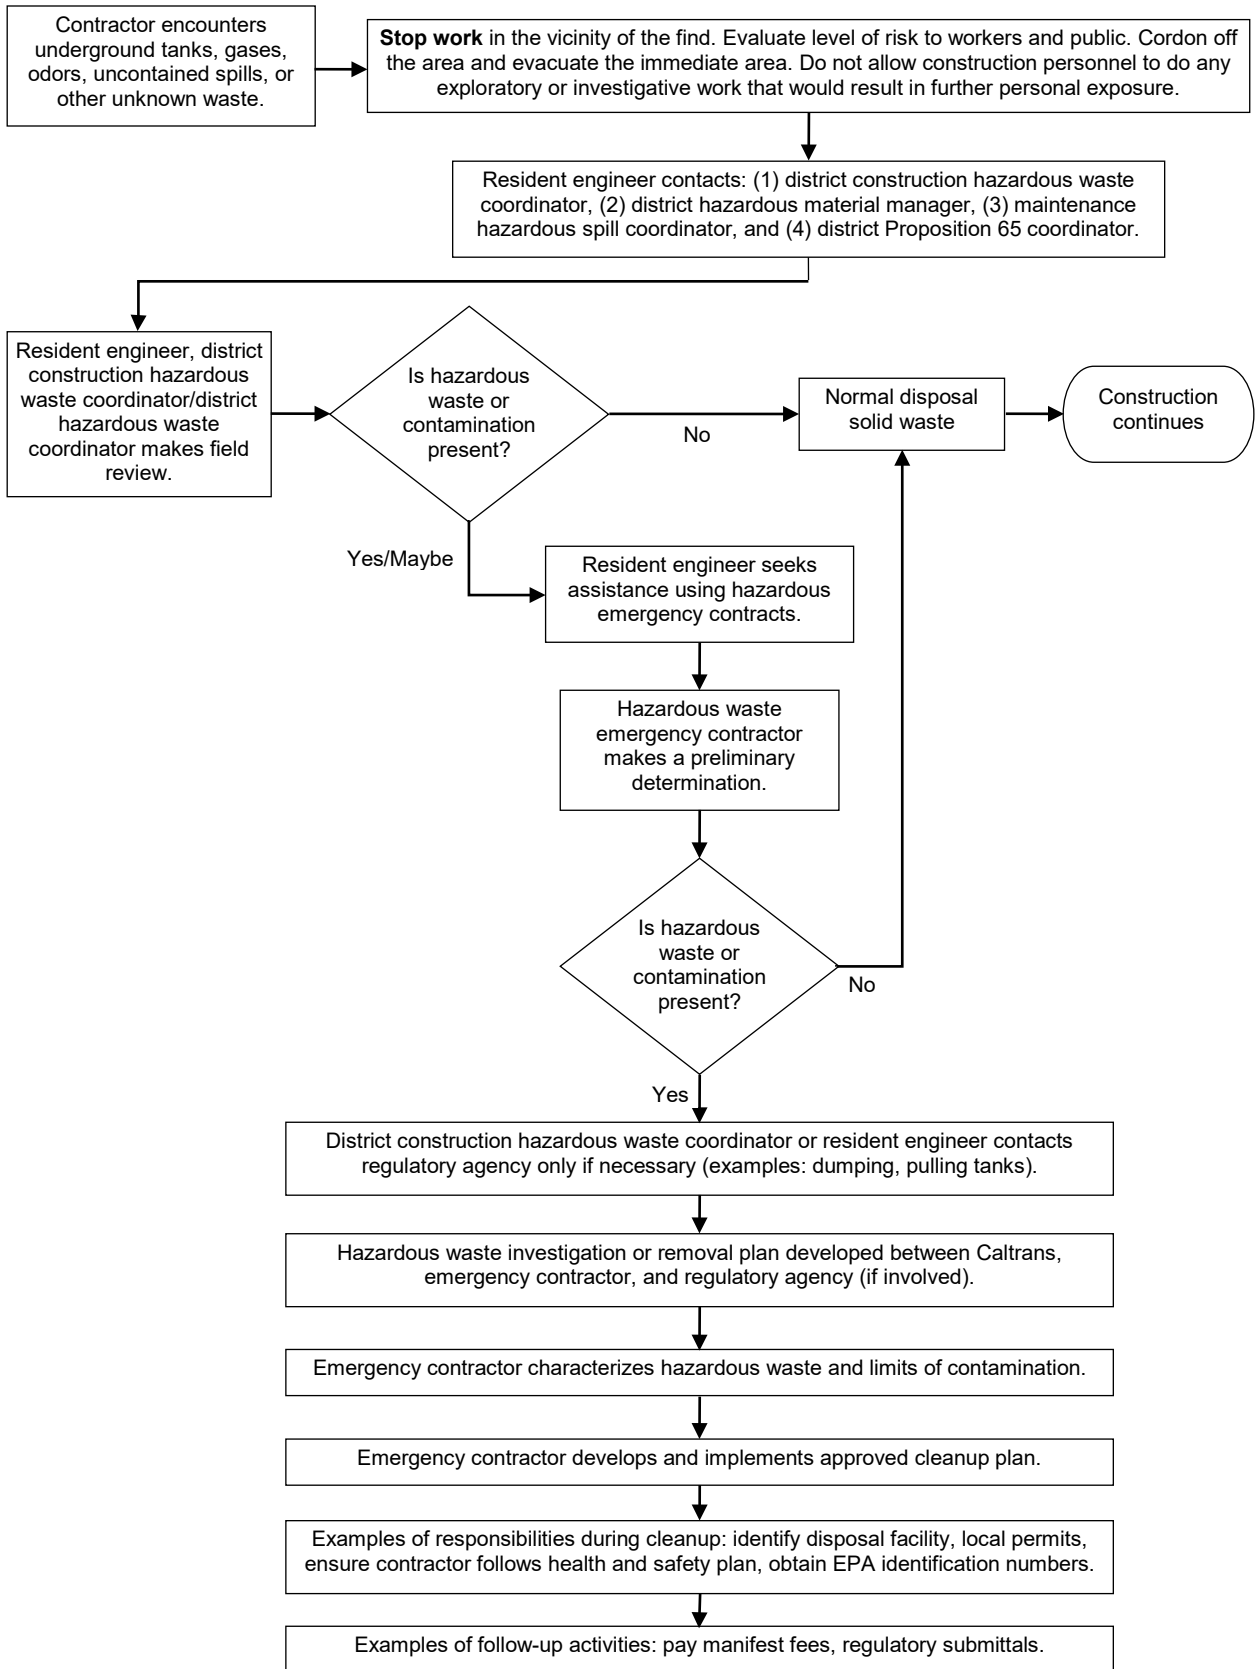

for Gerard J. Thibeault
Executive Officer
